Eighth-brick
DC-DC Converter

The BusQor® BQ55090ETA27 bus converter is a next-generation, board-mountable, isolated, fixed switching frequency DC-DC converter that uses synchronous rectification to achieve extremely high conversion efficiency. The power dissipated by the converter is so low that a heatsink is not required, which saves cost, weight, height, and application effort. The BusQor series provides an isolated step down voltage from 48 V to 9.6 V intermediate bus with no regulation in a standard eighth-brick module. BusQor converters are ideal for creating the mid-bus voltage required to drive point-of-load (non-isolated) converters in intermediate bus architectures. RoHS compliant (see last page).

BusQor®

BQ55090ETA27 Model

Operational Features

- Ultra-high efficiency, > 95% at full rated load current
- Delivers up to 27 amps of output current with minimal derating - no heatsink required
- Input voltage range: 35 V - 55 V provides 6.5 V - 11 V bus for distributed power architectures
- Fixed frequency switching provides predictable EMI performance

Control Features

- On/Off control referenced to input side (positive and negative logic options are available)

Safety Features

- CAN/CSA C22.2 No. 60950-1
- UL 60950-1
- EN 60950-1

Mechanical Features

- Industry standard eighth-brick bus converter pin-out
- Size: .90" x 2.3" (22.9 x 58.4 mm) 0.484" (12.29 mm)
- Total weight: 0.7 oz (20 g)

Protection Features

- Input under-voltage lockout and over-voltage shutdown protects against abnormal input voltages
- Output current limit and short circuit protection (auto recovery)
- Thermal shutdown

NOTES

- PINS 1-3 ARE 0.040" (1.02 mm) DIA. WITH 0.080" (2.03 mm) DIA. STANDOFF SHOULDERS
- PINS 4 & 5 ARE 0.062" (1.57 mm) DIA. WITH 0.100" (2.54 mm) DIA. STANDOFF SHOULDERS
- MAX SCREW DEPTH MUST NOT EXCEED .085" BELOW THE 0.100" (2.54mm) DIA. STANDOFF SHOULDERS
- SURFACE OF THE BASE PLATE
- ALL PINS: MATERIAL: COPPER ALLOY
FINISH: MATTE TIN OVER NICKEL PLATE
FOR VISUAL REFERENCE ONLY
- UNDIMENSIONED COMPONENTS ARE SHOWN FOR VISUAL REFERENCE ONLY
- ALL DIMENSIONS IN INCHES(mm)
TOLERANCES: X.XXIN +/-0.02 (X.Xmm +/-0.5mm)
X.XXXIN +/-0.010 (X.XXmm +/-0.25mm)
- WEIGHT: 0.7 oz (20 g)
- WORKMANSHIP: MEETS OR EXCEEDS IPC-A-610C CLASS II
- UL/TUV STANDARDS REQUIRE A CLEARANCE OF 0.04" (1.02 mm) AROUND PRIMARY AREAS OF THE MODULE.

PIN DESIGNATIONS

Pin	Name	Function
1	Vin(+)	Positive Input Voltage
2	ON/OFF	TTL input to turn converter on and off, referenced to Vin (-) with internal pull up
3	Vin(-)	Negative input voltage
4	Vout(-)	Negative output voltage
5	Vout(+)	Positive output voltage

Technical Specification

Input: 35-55 V
Output: 9.6 V
Current: 27 A
Package: Eighth-brick

BASIC OPERATION AND FEATURES

With voltages dropping and currents rising, the economics of an Intermediate Bus Architecture (IBA) are becoming more attractive, especially in systems requiring multiple low voltages. IBA systems separate the role of isolation and voltage scaling from regulation and sensing. The BusQor series bus converter provides isolation and a coarse voltage step down in one compact module, leaving regulation to simpler, less expensive non-isolated converters.

In Figure A below, the BusQor module provides the isolation stage of the IBA system. The isolated bus then distributes power to the non-isolated buck regulators to generate the required voltage levels at the point of load. In this case, the bucks are represented with SynQor's NiQor series of non-isolated dc/dc converters. In many applications requiring multiple low voltage outputs, significant savings can be achieved in board space and overall system costs.

When designing an IBA system with bus converters, the designer can select from a variety of bus voltages. While there is no universally ideal bus voltage, most designs employ one of the following: 12 V, 9 V, 7.5 V, 5 V, or 3.3 V. Higher bus voltages can lead to lower efficiency for the buck regulators but are more efficient for the bus converter and provide lower board level distribution current. Lower bus voltages offer the opposite trade offs.

SynQor's 9.6 Vout BusQor module acts as a true dc transformer. The output voltage is proportional to the input voltage, with a specified "turns ratio" or voltage ratio, plus minor drop from the internal resistive losses in the module. When used in IBA systems, the output variation of the BusQor must be in accordance with the input voltage range of the non-isolated converters being employed.

The BusQor architecture is very scalable, meaning multiple bus converters can be connected directly in parallel to allow current sharing for higher power applications.

CONTROL FEATURES

REMOTE ON/OFF (Pin 2): The ON/OFF input, Pin 2, permits the user to control when the converter is on or off. This input is referenced to the return terminal of the input bus, Vin(-). There are two versions of the converter that differ by the sense of the logic used for the ON/OFF input.

In the positive logic version, the ON/OFF input is active high (meaning that a high turns the converter on). In the negative logic version, the ON/OFF signal is active low (meaning that a low turns the converter on). Figure B is a detailed look of the internal ON/OFF circuitry. Positive logic enabled modules have N-channel FET populated. Negative logic enabled modules have P-channel FET populated.

Figure B: Internal ON/OFF pin circuitry

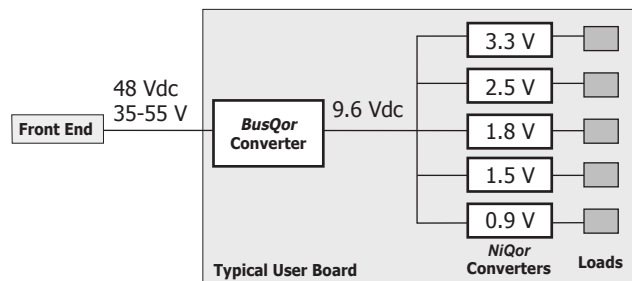

Figure A: Example of Intermediate Bus Architecture using BusQor bus converter and NiQor non-isolated converters

PROTECTION FEATURES

Input Under-Voltage Lockout: The converter is designed to turn off when the input voltage is too low, helping avoid an input system instability problem, described in more detail in the application note titled "Input System Instability". The lockout circuitry is a comparator with DC hysteresis. When the input voltage is rising, it must exceed the typical Turn-On Voltage Threshold value (listed on the specification page) before the converter will turn on. Once the converter is on, the input voltage must fall below the typical Turn-Off Voltage Threshold value before the converter will turn off. Also see Figure E.

Output Current Limit: The output of the BusQor module is electronically protected against output overloads. When an overload current greater than the "DC Current-Limit Inception" specification is drawn from the output, the output shuts down to zero volt in a period of 10 ms typical (see Figure C). The shutdown period lasts for a typical period of 250 ms (Figure D) after which the BusQor tries to power up again. If the overload persists, the output voltage will go through repeated cycles of shutdown and restart with a duty cycle of 3% (On) and 97% (Off) respectively. The BusQor module returns (auto resetting) to normal operation once the overload is removed. The BusQor is designed to survive in this mode indefinitely without damage and without human intervention.

Figure C: Output Overload protection diagram (not to scale)

Figure D: Output Short Circuit and Auto-Resetting protection diagram (not to scale)

Output Short Circuit Protection: When the output of the BusQor module is shorted, a peak current of typically 70 A will flow into the short circuit for a period of about 10 ms. The output of the BusQor will shutdown to zero volts for the same period (Figure E). The shutdown period lasts for a period of 250 ms, at the end of which the BusQor module tries to power up again. If the short circuit persists, the output voltage will go through repeated cycles of shutdown and restart with a duty cycle of 3% (On) and 97% (Off) respectively. The BusQor module returns (auto resetting) to normal operation once the short circuit is removed.

The BusQor is designed to survive in this mode indefinitely without damage and without human intervention. In the Auto resetting mode, also referred to as "Hiccup" mode, the power drawn from the 48 V input is about 5 Watts, most of which is dissipated into the external fault. It is important that copper traces and pads from the output circuit be designed to withstand the short term peaks, although the average current into the fault may be as low as 2 A typical. See Figure 17 for appropriate waveform.

Over-Temperature Shutdown: A temperature sensor on the converter senses the average temperature of the module. The thermal shutdown circuit is designed to turn the converter off when the temperature at the sensed location reaches the Over-Temperature Shutdown value. It will allow the converter to turn on again when the temperature of the sensed location falls by the amount of the Over-Temperature Shutdown Restart Hysteresis value.

APPLICATION CONSIDERATIONS

Start-Up Inhibit Period: Figure E details the Start-Up Inhibit Period for the BusQor module. At time t_0 , when V_{in} is applied with On/Off pin asserted (enabled), the BusQor output begins to build up. Before time t_1 , when the input voltage is below the UVL threshold, the unit is disabled by the Input Under-Voltage Lockout feature. When the input voltage rises above the UVL threshold, the Input Under-Voltage Lockout is released, and a typical Startup Inhibit Period of 3 ms is initiated. The output builds up to 90% or higher of the nominal voltage and stabilizes at the nominal value of 9.6 V. The rise time from 0 V to 90% is 4.5 ms typical.

At time t_2 , when the On/Off pin is de-asserted (disabled), the BusQor output instantly drops to 0V. Fall time from 9.6 V to 0 V is dependent on output capacitance and any parasitic trace inductance in the output load circuit. At time t_3 , when the On/Off pin is re-asserted (enabled), the BusQor module output begins to build up after the inhibit period of 2.5 ms typical. Refer to the Control Features section of the data sheet for details on enabling and disabling methods for N and P logic type modules.

Figure E: Power Up/Down Diagram (not to scale) showing Start-Up Inhibit Period

Figure F: Keep Out Areas for BusQor module

Keep Out Areas: **Component Keep Out Area:** Keep out areas for components not referenced to the Primary circuit are shown in shaded areas in Figure F. The keep out areas shown are consistent with UL's requirements for Basic Insulation of 0.04" (40 mils) for Pollution degree 2. User should consult UL standards for other insulation classes and operating environments.

For applications that require mounting parts BELOW the BusQor module, one should be aware of potential high levels of electromagnetic interference, in addition to safety keep out. Users are advised to consult SynQor Applications engineering in such applications.

Copper Keep Out Area: Keep out areas shown in Figure F are to be observed for Top layer copper traces and vias. Internal layers buried one or more layers may be exempt, depending on the PCB material grade and thickness. Users are advised to consult UL standards for details. All layers including top and bottom, are subject to the keep out areas shown around Primary pins of BusQor module. Actual keep outs along the surface (Creepage) may vary depending on the PCB material CTI. Users are advised to consult UL standards for details.

Bridging Components: Bridging components like EMI filter capacitors required to be placed as close as possible to the BusQor module for optimum performance must observe the clearance/creepage requirements of 0.04" (40 mils) between pads to maintain compliance to UL standards for the overall power system.

Note: Referenced keep out widths are adequate to withstand UL's Basic Insulation Dielectric strength tests for approved PCB materials. Applications requiring Double or Reinforced insulation must double the keep out widths shown in Figure F. Keep out areas shown have standard margins above UL's minimum requirements.

Figure G: Location of Sense Resistor

Output Load Current Calculation: The BusQor series allows the converter output load to be measured without adding a current loop or external shunt resistor to the designer's PCB board under test. On the top side of the BusQor converter is a current sense resistor as shown in Figure G. The output load current is proportional to the voltage drop across this sense resistor. This calculation is detailed below.

A current sense resistor referenced to the primary input is used in the equation below to calculate the output load current.

$$I_{load} = (VR_{sense}(load) - VR_{sense}(no\ load)) \times 1667$$

where:

I_{load} = output load current

$VR_{sense}(load)$ = voltage across the sense resistor with converter under load

$VR_{sense}(no\ load)$ = voltage across the sense resistor with converter at zero load

The number 1667 is a "Load Current Scale Factor" for this product, valid only for $V_{in} = 48\text{ V}$. Hence, measurement should be made at this input voltage. The voltage drop across the sense resistor is about 16.2 mV at full load of 27 A. Therefore, proper measuring techniques must be used to ensure accuracy. A calibrated DMM set to 300 mV is acceptable. Since this measurement is done on the Primary area of the converter, a slight non-linearity may be observed over the load current range. Using the Scale Factor referenced above, the error may be on the order of 4%. For more detailed information consult the application note on SynQor's web site titled "Output Load Current Calculations".

Figure H: BusQor Output Paralleling for increased current output

Figure I: Current share performance of 2 paralleled modules

Current Sharing: BusQor modules are designed to operate in parallel without the use of any external current share circuitry. A typical circuit for paralleling two BusQor modules is shown in Figure H. An output capacitor is recommended across each module and located close to the converter for optimum filtering and noise control performance. Dedicated input inductors are recommended but are considered optional. Input capacitors must be located close to the converter module. PCB layout in the input circuit should be such that high frequency ripple currents of each module is restricted to a loop formed by the input capacitors and the input terminals of the BusQor module. See Figure J for details on PCB layout. Contact SynQor application engineering for further assistance on PCB trace design.

The current share performance of two paralleled modules is illustrated in the graph in Figure I. In this graph the percent deviation from ideal sharing (50%) is plotted for each module versus the total output load current at 48 Vin.

Figure J: Recommended PCB layout for input circuit

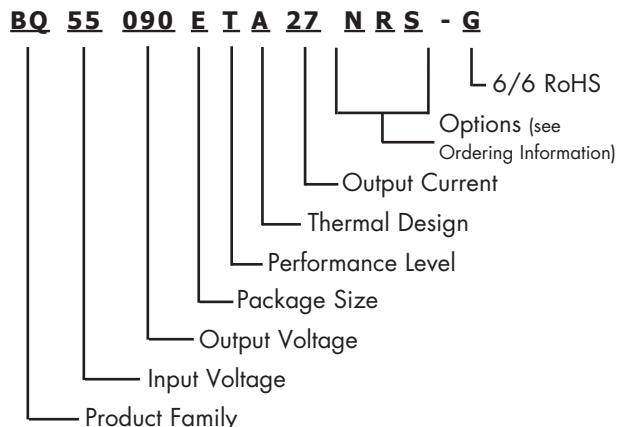

SynQor®

Ordering Information

Input: 35-55 V
Output: 9.6 V
Current: 27 A
Package: Eighth-brick

Part Numbering System

The part numbering system for SynQor's dc-dc converters follows the format shown in the example below.

The first 12 characters comprise the base part number and the last 3 characters indicate available options. The "-G" suffix indicates 6/6 RoHS compliance.

Application Notes

A variety of application notes and technical white papers can be downloaded in pdf format from our [website](#).

RoHS Compliance: The EU led RoHS (Restriction of Hazardous Substances) Directive bans the use of Lead, Cadmium, Hexavalent Chromium, Mercury, Polybrominated Biphenyls (PBB), and Polybrominated Diphenyl Ether (PBDE) in Electrical and Electronic Equipment. This SynQor product is 6/6 RoHS compliant. For more information please refer to SynQor's RoHS addendum available at our [RoHS Compliance / Lead Free Initiative web page](#) or e-mail us at rohs@synqor.com.

Ordering Information

The tables below show the valid model numbers and ordering options for converters in this product family. When ordering SynQor converters, please ensure that you use the complete 15 character part number consisting of the 12 character base part number and the additional characters for options. Add "-G" to the model number for 6/6 RoHS compliance.

Model Number	Input Voltage	Output Voltage	Max Output Current
BQ55090ETA27xyz	35 - 55 V	9.6 V	27 A

The following options must be included in place of the **wxyz** spaces in the model numbers listed above.

Options Description: wxyz			
Thermal Design	Enable Logic	Pin Length	Feature Set
A - Open Frame	P - Positive * N - Negative	K - 0.110" N - 0.145" R - 0.180" Y - 0.250"	S - Standard
* Consult the factory before ordering the P logic option			

Not all combinations make valid part numbers, please contact SynQor for availability.

Contact SynQor for further information and to order:
