**Half-brick**

## Military COTS DC-DC Bus Converters

<b>230-310 V</b> Input	<b>270 V</b> Output	<b>3.7 A</b> Current	<b>4250 Vdc</b> Isolation	<b>Half-brick</b> DC-DC Converter
---------------------------	------------------------	-------------------------	------------------------------	--------------------------------------

Full Operating Temperature Range is -55 °C to +100 °C

The MCOTS-B-270L-270-HT bus converter is a next-generation, board-mountable, isolated, fixed switching frequency DC-DC converter that uses synchronous rectification to achieve extremely high conversion efficiency. The MCOTS series provides an isolated 1 to 1 voltage from 230 V to 310 V intermediate bus with no regulation in a standard Half-brick module. MCOTS-B-270L-270-HT converter is ideal for creating the mid-bus voltage required to drive standard 270 V DC-DC isolated converters.

### MilCOTS™

Designed and manufactured in the USA.

#### Protection Features

- Input under-voltage and over voltage lockout protects against abnormal input voltages
- Output current limit and short circuit protection (auto recovery)
- Thermal shutdown

#### Control Features

- On/Off control referenced to input side
- Inherent current share (by droop method) for high current and parallel applications.
- Clock synchronization (primary referenced)

#### Mechanical Features

- Industry standard half-brick pin-out configuration
- Size: 2.39" x 2.49" x 0.51" (60.6 x 63.1 x 13.0 mm)
- Weight: 4.8 oz (137 g)

#### Specification Compliance

MCOTS series converters (with an MCOTS filter) are designed to meet:

- MIL-HDBK-704 (A-F)
- MIL-STD-461 (C, D, E, F)

#### Operational Features

- High efficiency, 96% at full rated load current
- Delivers 1000 W full power with minimal derating
- Operating input voltage range: 230-310 V
- Fixed frequency switching provides predictable EMI
- No minimum load requirement

#### Safety Features

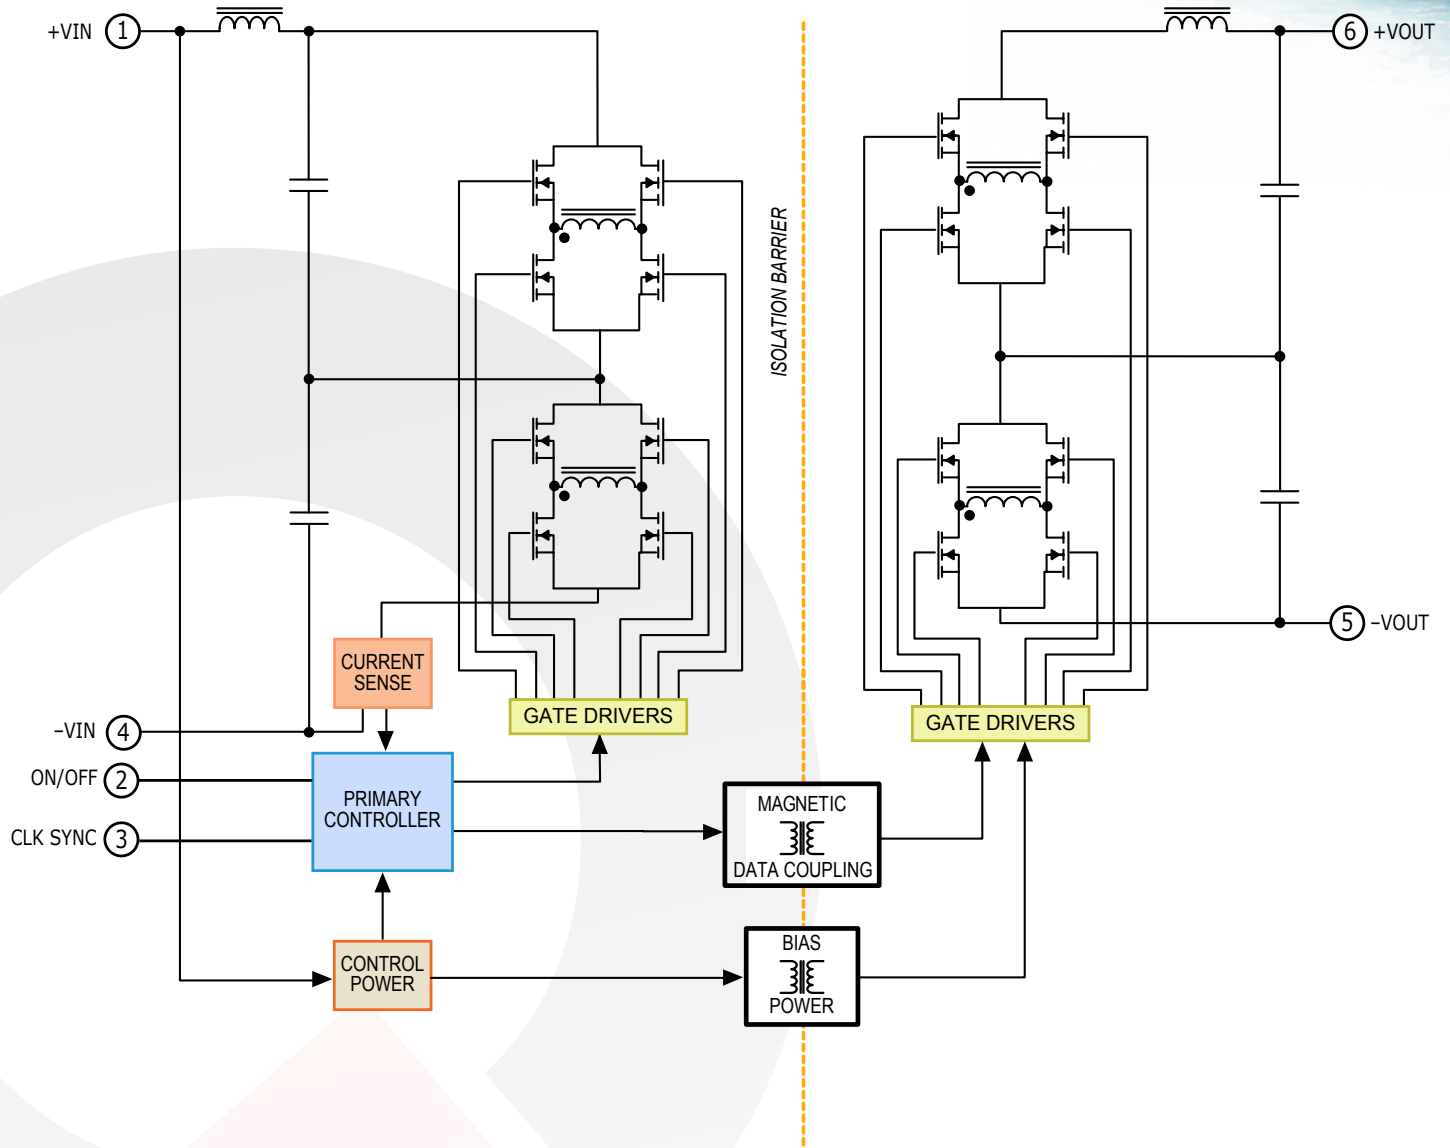

- Pending
- 4250V dc, 100 MΩ input-to-output isolation
- (see Standards and Qualifications page)

#### Screening/Qualification

- AS9100 and ISO 9001 certified facility
- Qualification consistent with MIL-STD-883
- Available with S-Grade or M-Grade screening
- Pre-cap inspection per IPC-A-610, Class III
- Temperature cycling per MIL-STD-883, Method 1010, Condition B, 10 cycles
- Burn-In at 100 °C baseplate temperature
- Final visual inspection per MIL-STD-883, Method 2009
- Full component traceability

Note 1: Converter will undergo input over-voltage shutdown.

Note 2: UL's product certification tests were carried out using 20 A fast blow fuse. Fuse interruption characteristics have to be taken into account while designing input traces. User should ensure that Input trace is capable of withstanding fault currents

Note 3: For applications requiring reduced output voltage ripple and noise, consult SynQor applications support (e-mail: support@synqor.com)

Note 4: Starting up under full load can result in hic-up operation (shut down).

Note 5: Isolation capacitance can be added external to the module .

Note 6: 1 minute for qualification test, and less than 1 minute in production.

Note 7: Fundamental ripple frequency is 2 \* fs

Parameter	Notes & Conditions
<b>STANDARDS COMPLIANCE</b>	
UL 62368-1	Pending
CAN/CSA-C22.2 No. 62368-1	Reinforced Insulation
EN 62368-1	

Note: An external input fuse must always be used to meet these safety requirements. Contact SynQor for official safety certificates on new releases or download from the SynQor website.

## Application Section

### BASIC OPERATION AND FEATURES

With voltages dropping and currents rising, the economics of an Intermediate Bus Architecture (IBA) are becoming more attractive, especially in systems requiring multiple low voltages. IBA systems separate the role of isolation and voltage scaling from regulation and sensing. The BusQor series bus converter provides isolation and an unregulated voltage step down in one compact module, leaving regulation to simpler, less expensive non-isolated converters.

In Figure A below, the BusQor module provides the isolation stage of the IBA system. The isolated bus then distributes power to the non-isolated buck regulators to generate the required voltage levels at the points of load. In this case, the bucks are represented with SynQor's NiQor series of non-isolated DC-DC converters. In many applications requiring multiple low voltage outputs, significant savings can be achieved in board space and overall system costs.

When designing an IBA system with bus converters, the designer can select from a variety of bus voltages. While there is no universally ideal bus voltage, most designs employ either 270 V or 28 V. The MCOTS-B-270L-270-HT has been designed to provide an isolated bus voltage of 270V when the input to the BusQor converter is 270V.

SynQor's BusQor modules act as a true dc transformer. The output voltage is proportional to the input voltage, with a specified "turns ratio" or voltage ratio, plus minor drop from the internal resistive losses in the module. When used in IBA systems, the output variation of the BusQor must be in accordance with the input voltage range of the non-isolated converters being employed.

The BusQor architecture is very scalable, meaning multiple bus converters can be connected directly in parallel to allow current sharing for higher power applications.

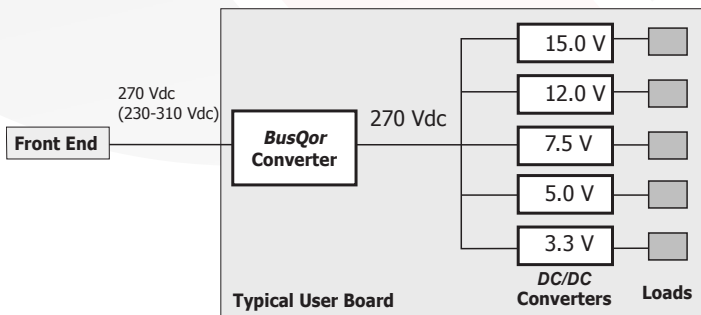

Figure A: Example of Intermediate Bus Architecture using isolated or non-isolated converters.

### CONTROL FEATURES

**REMOTE ON/OFF (Pin 2):** The ON/OFF input, Pin 2, permits the user to control when the converter is on or off. This input is referenced to the return terminal of the input bus, Vin(-).

In the negative logic version, the ON/OFF signal is active low (meaning that a low turns the converter on). Figure B is a detailed look of the internal ON/OFF circuitry.

Figure B: Internal ON/OFF pin circuitry

**SYNCHRONIZATION:** The MCOTS converter's switching frequency can be synchronized to an external frequency source that is in the 500 kHz to 600 kHz range. A pulse train at the desired frequency should be applied to the CLK SYNC pin (pin 3) with respect to the Vin(-) (pin 4). This pulse train should have a duty cycle in the 20% to 80% range. Its low value should be below 0.8 V to be guaranteed to be interpreted as a logic low, and its high value should be above 2.0 V to be guaranteed to be interpreted as a logic high. The transition time between the two states should be less than 300 ns.

If the MCOTS converter is not to be synchronized, the CLK SYNC pin should be left open circuit. The converter will then operate in its free-running mode at a frequency of approximately 550 kHz (twice the switching frequency).

If, due to a fault, the CLK SYNC pin is held in either a logic low or logic high state continuously, or the CLK SYNC frequency is outside the 500-600 kHz range, the MCOTS converter will revert to its free-running frequency.

## Application Section

### PROTECTION FEATURES

**Input Under-Voltage Lockout:** The converter is designed to turn off when the input voltage is too low, helping avoid an input system instability problem, described in more detail in the application note titled "Input System Instability". The lockout circuitry is a comparator with DC hysteresis. When the input voltage is rising, it must exceed the typical Turn-On Voltage Threshold value (listed on the specification page) before the converter will turn on. Once the converter is on, the input voltage must fall below the typical Turn-Off Voltage Threshold value before the converter will turn off. Also see Figure F.

**Input Over-Voltage Shutdown:** The converter includes a two stage over-voltage feature that limits the converter's duty cycle for 100 ms before shutdown when input voltage is below the max transient voltage with a load current greater than 1 A and an automatic shutdown with no delay when above the max transient voltage (See the Input Over-Voltage Shutdown section in the Electrical Characteristics Table for specific voltage levels). It also has a hysteresis and time delay to ensure proper operation.

**Input Under-Voltage Shutdown:** The converter includes a two stage under-voltage feature that allows the unit to continue running when input voltage is above the minimum transient voltage with a load current less than 2A or for 100ms above 2A. An automatic shutdown with no delay occurs when below the minimum transient voltage (See the Input Over-Voltage Shutdown section in the Electrical Characteristics Table for specific voltage levels).

**Output Current Limit:** The output of the BusQor module is electronically protected against output overloads. When an overload current greater than the "DC Current-Limit Inception" specification is drawn from the output for more than 2ms, the output shuts down to zero volts (see Figure D). The shutdown period lasts typically 250 ms (Figure E) after which the BusQor tries to power up again. If the overload persists, the output voltage will go through repeated cycles of shutdown and restart.

Figure D: Output Overload protection diagram (not to scale)

Figure E: Output Short Circuit and Auto-Resetting protection diagram (not to scale)

The BusQor module returns (auto resetting) to normal operation once the overload is removed. The BusQor is designed to survive in this mode indefinitely without damage and without human intervention.

**Output Short Circuit Protection:** When the output of the BusQor module is shorted, a peak current of typically 20 A will flow into the short circuit for a period not greater than 1 ms (typically 200  $\mu$ S). The output of the BusQor will shutdown to zero for  $\sim$ 250 ms (Figure E). Afterward, the BusQor module tries to power up again. If the short circuit persists, the output voltage will go through repeated cycles of shutdown and restart with a reduced duty cycle. The BusQor module returns (auto resetting) to normal operation once the short circuit is removed. The BusQor is designed to survive in this mode indefinitely without damage and without human intervention.

In the Auto resetting mode, also referred to as "Hiccup" mode, the power drawn from the 270 V input is  $\sim$ 10 Watts, most of which is dissipated into the external fault. It is important that copper traces and pads from the output circuit be designed to withstand the short term peaks, although the average input current into the fault may be as low as 0.026 A typical. See Figure 17 for appropriate waveform.

**Over-Temperature Shutdown:** A temperature sensor on the converter senses the average temperature of the module. The thermal shutdown circuit is designed to turn the converter off when the temperature at the sensed location reaches the Over-Temperature Shutdown value. It will allow the converter to turn on again when the temperature of the sensed location falls by the amount of the Over-Temperature Shutdown Restart Hysteresis value.

**MCOTS-B-270L-270-HT**  
**Input: 230-310 V**  
**Output: 270 V**  
**Current: 3.7 A**

## Application Section

### APPLICATION CONSIDERATIONS

**Start-Up Inhibit Period:** Figure F details the Start-Up Inhibit Period for the BusQor module. At time  $t_0$ , the On/Off pin is asserted (enabled), and the BusQor input voltage ( $V_{in}$ ) begins to rise. Before time  $t_1$ , when the input voltage is below the UVL threshold, the unit is disabled by the Input Under-Voltage Lockout feature. At time  $t_1$ , when the input voltage rises above the UVL threshold, the Input Under-Voltage Lockout is released and a typical Initial Startup Inhibit Period of 15 ms is initiated. The output rises to 90% of the nominal value of 270 V in a period of 280 ms typical (50% load). Once the unit has reached steady state operation ( $\sim 120$  ms after time  $t_1$ ), the unit can be loaded to its full rated output current.

At time  $t_2$ , when the On/Off pin is de-asserted (disabled), the BusQor output instantly drops to 0 V. Fall time from 270 V to 0 V is dependent on output capacitance and any parasitic trace inductance in the output load circuit.

At time  $t_3$ , when the On/Off pin is re-asserted (enabled), the BusQor module output begins to build up after the inhibit period of 250 ms typical has elapsed.

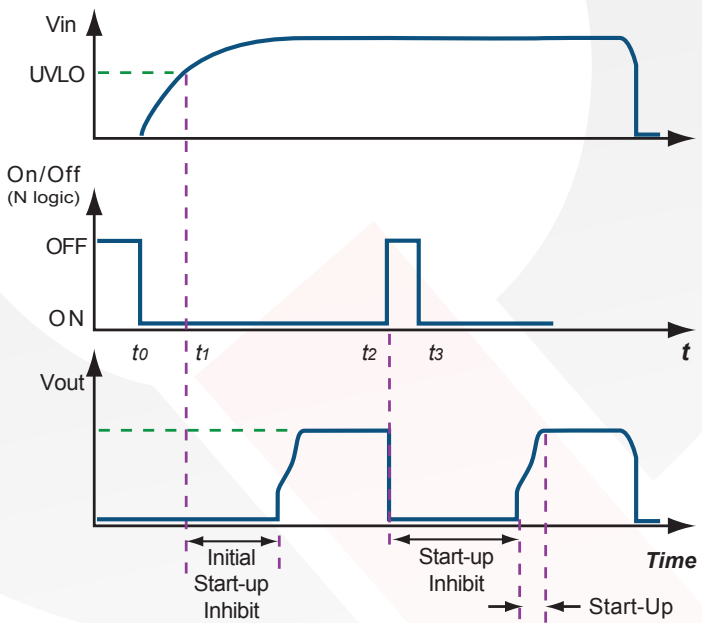

Figure F: Power Up/Down Diagram (not to scale) showing Start-Up Inhibit Period

Refer to the Control Features section of the data sheet for details on enabling and disabling methods for Bus Qor modules.

### Thermal Derating Test Setup

The curves showing the derating of output current and power as a function of the baseplate temperature are taken with the oven setup shown in Fig. G. The converter module is soldered to a carrier PCB that is mounted horizontally within an oven. The carrier PCB is a four layer 4 oz PCB. A large aluminum heatsink (thermal grease is applied between the baseplate and the heatsink interface to minimize the thermal impedance) is attached to the baseplate to keep the baseplate temperature constant during thermal testing. A small hole is drilled through the heatsink in order to attach a thermocouple to the baseplate of the DUT. Additional thermocouples are attached to the hottest components before baseplating to monitor the internal temperature of all of the critical components during testing. The oven temperature is controlled so as to keep the baseplate temperature to the desired value. The baseplate temperature is kept at 100 °C or below for all conditions. If the temperature of an internal component exceeds 125 °C, the output current (power level) is reduced so as to keep the temperature of all internal components below 125 °C.

Figure G: Thermal chamber setup for derating curves.

## Application Section

**Current Sharing:** MCOTS BusQor modules are designed to operate in parallel without the use of any external current share circuitry. Current sharing is achieved through “Droop Share”. An output capacitor of 120uF minimum should be used across each module and located close to the converter for optimum filtering and noise control performance. Dedicated input inductors are recommended but are considered optional. Input capacitors must be located close to the converter module. PCB layout in the input circuit should be such that high frequency ripple currents of each module is restricted to a loop formed by the input capacitors and the input terminals of the BusQor module. See Figure H for details on PCB layout. Contact SynQor application engineering for further assistance on PCB trace design.

The current share performance of two paralleled modules is illustrated in the graph in Figure I. In this graph the current deviation from ideal sharing (50%) is plotted for each module versus the total output load current at 270 Vin. Two MCOTS 270 Bus Qor’s will share within 10% at higher loads. The current share accuracy is affected by changes in the gate drive timing. The gate drive timing is adjusted as a function of load to better optimize the product efficiency over line and load (performance), resulting in higher load share deviations at lighter loads.

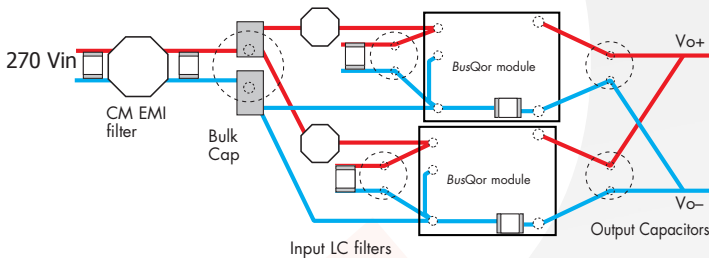

Figure H: Recommended physical implementation of two Bus Qor’s in parallel.

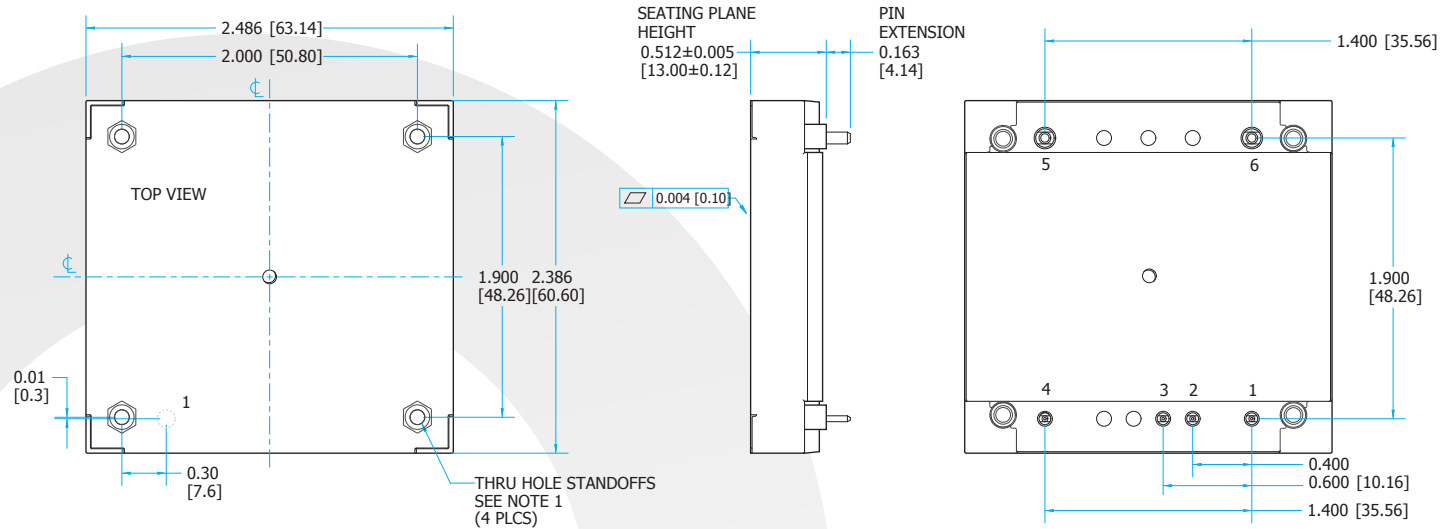

Figure I: Typical current share performance of 2 paralleled modules

Temperature Cycling	MIL-STD-883F, Method 1010, Condition B, 10 Cycles		•
Burn-In	100 °C Baseplate	12 Hours	96 Hours
Final Electrical Test	100%	25 °C	-55 °C, +25 °C, +100 °C
Final Visual Inspection	MIL-STD-883F, Method 2009	•	•

### Mil-COTS MIL-STD-810G Qualification Testing

MIL-STD-810G Test	Method	Description
Fungus	508.6	Table 508.6-I
Altitude	500.5 - Procedure I	Storage: 70,000 ft / 2 hr duration
	500.5 - Procedure II	Operating: 70,000 ft / 2 hr duration; Ambient Temperature
Rapid Decompression	500.5 - Procedure III	Storage: 8,000 ft to 40,000 ft
Acceleration	513.6 - Procedure II	Operating: 15 g
Salt Fog	509.5	Storage
High Temperature	501.5 - Procedure I	Storage: 135 °C / 3 hrs
	501.5 - Procedure II	Operating: 100 °C / 3 hrs
Low Temperature	502.5 - Procedure I	Storage: -65 °C / 4 hrs
	502.5 - Procedure II	Operating: -55 °C / 3 hrs
Temperature Shock	503.5 - Procedure I - C	Storage: -65 °C to 135 °C; 12 cycles
Rain	506.5 - Procedure I	Wind Blown Rain
Immersion	512.5 - Procedure I	Non-Operating
Humidity	507.5 - Procedure II	Aggravated cycle @ 95% RH (Figure 507.5-7 aggravated temp - humidity cycle, 15 cycles)
Random Vibration	514.6 - Procedure I	10 - 2000 Hz, PSD level of 1.5 g <sup>2</sup> /Hz (54.6 g <sub>rms</sub> ), duration = 1 hr/axis
Shock	516.6 - Procedure I	20 g peak, 11 ms, Functional Shock (Operating no load) (saw tooth)
	516.6 - Procedure VI	Bench Handling Shock
Sinusoidal vibration	514.6 - Category 14	Rotary wing aircraft - helicopter, 4 hrs/axis, 20 g (sine sweep from 10 - 500 Hz)
Sand and Dust	510.5 - Procedure I	Blowing Dust
	510.5 - Procedure II	Blowing Sand

**MCOTS-B-270L-270-HT**  
**Input: 230-310 V**  
**Output: 270 V**  
**Current: 3.7 A**

**Ordering Section**

**Ordering Information/ Part Numbering**

Example: MCOTS-B-270L-270-HT-N-M

Not all combinations make valid part numbers, please contact SynQor for availability. See [product summary page](#) for details.

Family	Product	Input Voltage	Output Voltage	Package	Thermal Design	Screening Level	Options
<b>MCOTS</b>	<b>B:</b> Bus Converter	<b>270L:</b> 230-310V	<b>270:</b> 270V	<b>HT:</b> Half Brick Tera	<b>N:</b> Normal Threaded <b>D:</b> Normal Non-Threaded <b>F:</b> Flanged	<b>S:</b> S-Grade <b>M:</b> M-Grade	<b>[ ]:</b> Standard Feature

**Application Notes**

A variety of application notes and technical white papers can be downloaded in pdf format from our website.

**Contact SynQor for further information and to order:**

**Phone:** 978-849-0600 **Toll Free:** 888-567-9596 **Fax:** 978-849-0602  
**E-mail:** [power@synqor.com](mailto:power@synqor.com) **Web:** [www.synqor.com](http://www.synqor.com)  
**Address:** 155 Swanson Road, Boxborough, MA 01719 USA

**WARRANTY**

SynQor offers a two (2) year limited warranty. Complete warranty information is listed on our website or is available upon request from SynQor.

**PATENTS**

SynQor holds numerous U.S. patents, one or more of which apply to most of its power conversion products. Any that apply to the product(s) listed in this document are identified by markings on the product(s) or on internal components of the product(s) in accordance with U.S. patent laws. SynQor's patents include the following:

- 7,050,309    7,765,687    7,787,261
- 8,149,597    8,644,027
