

## MILITARY COTS DC-DC CONVERTER

<b>155-425V</b> Continuous Input	<b>155-475V</b> Transient Input	<b>3.3V</b> Output	<b>30A</b> Output	<b>86% @ 15A / 86% @ 30A</b> Efficiency
-------------------------------------	------------------------------------	-----------------------	----------------------	--

Operation: -55°C to +100°C

The MilQor® series of Mil-COTS DC-DC converters brings SynQor's field proven high-efficiency synchronous rectification technology to the Military/Aerospace industry. SynQor's ruggedized encased packaging approach ensures survivability in demanding environments. Compatible with the industry standard format, these converters operate at a fixed frequency, and follow conservative component derating guidelines. They are designed and manufactured to comply with a wide range of military standards.

# MilCOTS™

Designed and Manufactured in the USA

### Safety Features

- 4250V dc, 100 MΩ input-to-output isolation
- (see Standards and Qualifications page)

### Mechanical Features

- Industry standard quarter-brick pin-out
- Size: 1.54" x 2.39" x 0.50"  
(39.0 x 60.6 x 12.7 mm)
- Total weight: 3.2 oz. (91 g)
- Flanged baseplate version available

### Protection Features

- Input under-voltage lockout/over-voltage shutdown
- Output current limit and short circuit protection
- Active back bias limit
- Output over-voltage protection
- Thermal shutdown

### Specification Compliance

MCOTS series converters (with an MCOTS filter) are designed to meet:

- MIL-HDBK-704 (A-F)
- MIL-STD-461 (C, D, E, F)

### Operational Features

- High efficiency, 86% at full rated load current
- Operating input voltage range: 155-425V
- Fixed frequency switching provides predictable EMI
- No minimum load requirement

### Control Features

- On/Off control referenced to input return
- Remote sense for the output voltage
- Output voltage trim range of +10%, -15%

### Screening/Qualification

- AS9100 and ISO 9001 certified facility
- Qualified to MIL-STD-810
- Available with S-Grade or M-Grade screening
- Pre-cap inspection per IPC-A-610, Class III
- Temperature cycling per MIL-STD-883, Method 1010, Condition B, 10 cycles
- Burn-In at 100 °C baseplate temperature
- Final visual inspection per MIL-STD-883, Method 2009
- Full component traceability

### MCOTS-C-270-3R3-QT ELECTRICAL CHARACTERISTICS

Tb = 25 °C, Vin = 270Vdc unless otherwise noted; full operating temperature range is -55 °C to +100 °C baseplate temperature with appropriate power derating. Specifications subject to change without notice.

Parameter	Min.	Typ.	Max.	Units	Notes & Conditions
<b>ABSOLUTE MAXIMUM RATINGS</b>					
Input Voltage					
Non-Operating	-1		600	V	Continuous
Operating			425	V	Continuous
Operating Transient Protection			475	V	1s transient, square wave
Isolation Voltage					
Input to Output			4250	V dc	Reinforced Insulation
Input to Base-Plate			2300	V dc	Basic Insulation
Output to Base-Plate			2300	V dc	Basic Insulation
Operating Temperature	-55		100	°C	Baseplate temperature
Storage Temperature	-65		135	°C	
Voltage at ON/OFF input pin	-2		18	V	
<b>INPUT CHARACTERISTICS</b>					
Operating Input Voltage Range	155	270	425	V	475V transient for 1s
Input Under-Voltage Turn-On Threshold	145	150	155	V	
Input Under-Voltage Turn-Off Threshold	133	140	147	V	
Input Over-Voltage Turn-Off Threshold	475	500	525	V	
Input Over-Voltage Turn-On Threshold	430	453	475	V	
Recommended External Input Capacitance		3.3		µF	Typical ESR 8Ω; see Note 1
Input Filter Component Values (L/C)		56\0.272		µH\µF	Internal values; see Figure E
Maximum Input Current			1.0	A	Vin min; trim up; in current limit
No-Load Input Current		23	35	mA	
Disabled Input Current		5	10	mA	
Response to Input Transient		0.18		V	See Figure 12
Input Terminal Ripple Current		20		mA	RMS, Full load
Recommended Input Fuse			3	A	Fast acting external fuse recommended
<b>OUTPUT CHARACTERISTICS</b>					
Output Voltage Set Point	3.267	3.3	3.333	V	
Output Voltage Regulation					
Over Line		±0.1	±0.3	%	
Over Load		±0.1	±0.3	%	
Over Temperature	-50		50	mV	
Total Output Voltage Range	3.22		3.38	V	Over sample, line, load, temperature & life
Output Voltage Ripple and Noise					
Peak-to-Peak	0	35	70	mV	Full load
RMS		10	20	mV	Full load
Operating Output Current Range	0		30	A	Subject to thermal derating
Output DC Current-Limit Inception	31	37.5	44	A	Output voltage 10% Low
Output DC Current-Limit Shutdown Voltage		2.3		V	
Back-Drive Current Limit while Enabled		5		A	Negative current drawn from output
Back-Drive Current Limit while Disabled		5		mA	Negative current drawn from output
Maximum Output Capacitance			10000	µF	Vout nominal at full load (resistive load)
Output Voltage during Load Current Transient					
Step Change in Output Current (0.1 A/µs)		50		mV	50% to 75% to 50% Iout max
Settling Time		200		µs	To within 1% Vout nom
Output Voltage Trim Range	-15		10	%	Across Pins 8&4; Figure C; see Note 3
Output Voltage Remote Sense Range			10	%	Across Pins 8&4
Output Over-Voltage Protection	115	125	137	%	Over full temp range; % of nominal Vout
<b>EFFICIENCY</b>					
100% Load		86		%	See Figure 1 for efficiency curve
50% Load		86		%	See Figure 1 for efficiency curve

Note 1: An input capacitor with series resistance is necessary to provide system stability.

Note 2: Output is terminated with 1 µF ceramic and 15 µF low-ESR tantalum capacitors. For applications requiring reduced output voltage ripple and noise, consult SynQor applications support (e-mail: mqnbofae@synqor.com)

Note 3: Trim-up range is limited below 10% at low line and full load. Applying more than 5.0V between trim pin and Vout(-) may damage the unit.

### MCOTS-C-270-3R3-QT ELECTRICAL CHARACTERISTICS

Tb = 25 °C, Vin = 270Vdc unless otherwise noted; full operating temperature range is -55 °C to +100 °C baseplate temperature with appropriate power derating. Specifications subject to change without notice.

Parameter	Min.	Typ.	Max.	Units	Notes & Conditions

**Output: 3.3V**

**Current: 30A**

**Application Section**

**BASIC OPERATION AND FEATURES**

This Mil-COTS converter series uses a two-stage power conversion topology. The first stage is a buck-converter that keeps the output voltage constant over variations in line, load, and temperature. The second stage uses a transformer to provide the functions of input/output isolation and voltage step-up or step-down to achieve the output voltage required.

Both the first stage and the second stage switch at a fixed frequency for predictable EMI performance. Rectification of the transformer's output is accomplished with synchronous rectifiers. These devices, which are MOSFETs with a very low on-state resistance, dissipate far less energy than Schottky diodes. This is the primary reason that the converter has such high efficiency, even at very low output voltages and very high output currents.

These converter are offered totally encased to withstand harsh environments and thermally demanding applications. Dissipation throughout the converter is so low that it does not require a heatsink for operation in many applications; however, adding a heatsink provides improved thermal derating performance in extreme situations.

This series of converters use the industry standard footprint and pin-out configuration.

**CONTROL FEATURES**

**REMOTE ON/OFF (Pin 2):** The ON/OFF input, Pin 2, permits the user to control when the converter is on or off. This input is referenced to the return terminal of the input bus, Vin(-). The ON/OFF signal is active low (meaning that a low turns the converter on). Figure A details four possible circuits for driving the ON/OFF pin. Figure B is a detailed look of the internal ON/OFF circuitry.

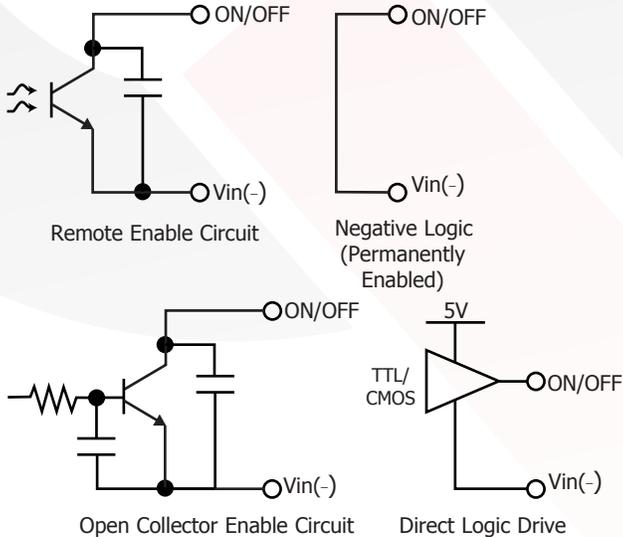

**REMOTE SENSE(±) (Pins 7 and 5):** The SENSE(±) inputs correct for voltage drops along the conductors that connect the converter's output pins to the load.

Pin 7 should be connected to Vout(+) and Pin 5 should be connected to Vout(-) at the point on the board where regulation is desired. A remote connection at the load can adjust for a voltage drop only as large as that specified in this datasheet, that is

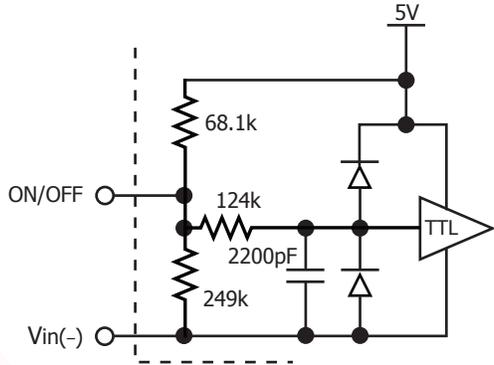

$$[V_{out(+)} - V_{out(-)}] - [V_{sense(+)} - V_{sense(-)}] \leq \text{Sense Range \%} \times V_{out}$$

Pins 7 and 5 must be connected for proper regulation of the output voltage. If these connections are not made, the converter will deliver an output voltage that is slightly higher than its specified value.

Note: the output over-voltage protection circuit senses the voltage across the output (pins 8 and 4) to determine when it should trigger, not the voltage across the converter's sense leads (pins 7 and 5). Therefore, the resistive drop on the board should be small enough so that output OVP does not trigger, even during load transients.

**Figure A:** Various circuits for driving the ON/OFF pin.

**Figure B:** Internal ON/OFF pin circuitry

**MCOTS-C-270-3R3-QT**

**Output: 3.3V**

**Current: 30A**

# Application Section

**OUTPUT VOLTAGE TRIM (Pin 6):** The TRIM input permits the user to adjust the output voltage across the sense leads up or down according to the trim range specifications.

To decrease the output voltage, the user should connect a resistor between Pin 6 and Pin 5 (SENSE(-) input). For a desired decrease of the nominal output voltage, the value of the resistor should be

$$R_{\text{trim-down}} = \left( \frac{90.9}{\Delta\%} \right) - 0.909 \text{ (k}\Omega\text{)}$$

where

$$\Delta\% = \left| \frac{V_{\text{nominal}} - V_{\text{desired}}}{V_{\text{nominal}}} \right| \times 100\%$$

To increase the output voltage, the user should connect a resistor between Pin 6 and Pin 7 (SENSE(+) input). For a desired increase of the nominal output voltage, the value of the resistor should be

$$R_{\text{trim-up}} = \left( \frac{1.0V_{\text{out}} \times (100 + \Delta\%)}{1.225\Delta\%} - \frac{90.9}{\Delta\%} - 0.909 \right) \text{ (k}\Omega\text{)}$$

where  $V_{\text{out}}$  = Nominal Output Voltage

Trim graphs show the relationship between the trim resistor value and Rtrim-up and Rtrim-down, showing the total range the output voltage can be trimmed up or down.

**Note:** the TRIM feature does not affect the voltage at which the output over-voltage protection circuit is triggered. Trimming the output voltage too high may cause the over-voltage protection circuit to engage, particularly during transients.

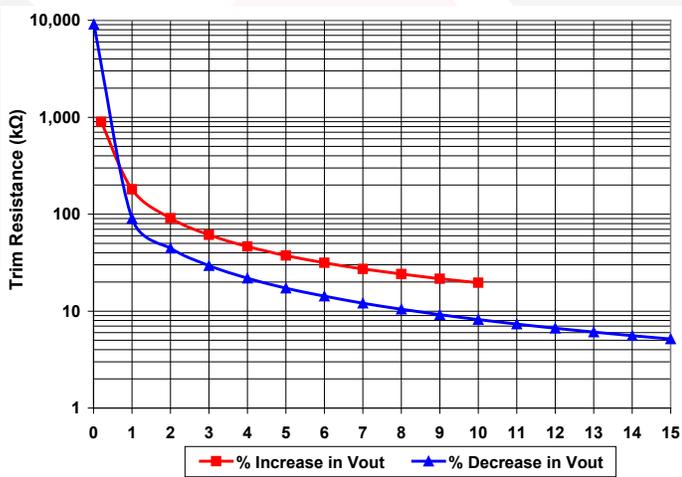

Figure C: Trim graph for trim-up, trim down.

It is not necessary for the user to add capacitance at the Trim pin. The node is internally bypassed to eliminate noise.

**Total DC Variation of  $V_{\text{out}}$ :** For the converter to meet its full specifications, the maximum variation of the dc value of  $V_{\text{out}}$  due to both trimming and remote load voltage drops, should not be greater than that specified for the output voltage trim range.

## PROTECTION FEATURES

**Input Under-Voltage Lockout:** The converter is designed to turn off when the input voltage is too low, helping avoid an input system instability problem, described in more detail in the application note titled "Input System Instability" on our website. The lockout circuitry is a comparator with dc hysteresis. When the input voltage is rising, it must exceed the typical Turn-On Voltage Threshold value (listed on the specifications page) before the converter will turn on. Once the converter is on, the input voltage must fall below the typical Turn-Off Voltage Threshold value before the converter will turn off.

**Output Over-Voltage Limit:** If the voltage across the output pins exceeds the Output Over-Voltage Protection threshold, the converter will immediately stop switching. This prevents damage to the load circuit due to 1) excessive series resistance in output current path from converter output pins to sense point, 2) a release of a short-circuit condition, or 3) a release of a current limit condition. Load capacitance determines exactly how high the output voltage will rise in response to these conditions. After 200 ms the converter will automatically restart.

**Over-Temperature Shutdown:** A temperature sensor on the converter senses the average temperature of the module. The thermal shutdown circuit is designed to turn the converter off when the temperature at the sensed location reaches the Over-Temperature Shutdown value. It will allow the converter to turn on again when the temperature of the sensed location falls by the amount of the Over-Temperature Shutdown Restart Hysteresis value.

**Output Current Limit:** The maximum current limit remains constant as the output voltage drops. However, once the impedance of the load across the output is small enough to make the output voltage drop below the specified Output DC Current-Limit Shutdown Voltage, the converter turns off.

The converter then enters a "hiccup" mode where it repeatedly turns on and off at a 5 Hz (nominal) frequency with 20% duty cycle until the short circuit condition is removed. This prevents excessive heating of the converter or the load board.

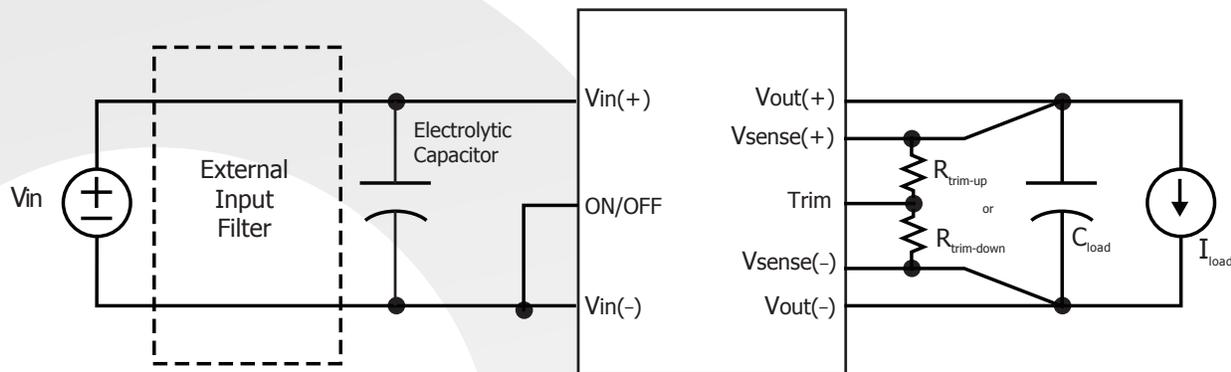

# Application Section

## APPLICATION CONSIDERATIONS

**Input System Instability:** This condition can occur because any dc-dc converter appears incrementally as a negative resistance load. A detailed application note titled "Input System Instability" is available on the SynQor website which provides an understanding of why this instability arises, and shows the preferred solution for correcting it.

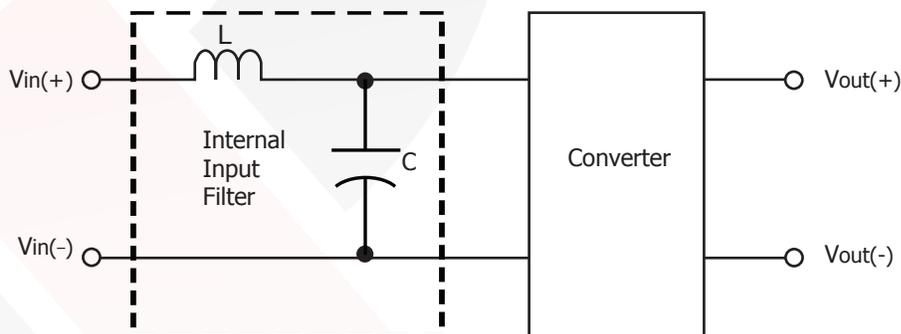

**Application Circuits:** Figure D provides a typical circuit diagram which details the input filtering and voltage trimming.

*Figure D: Typical application circuit (negative logic unit, permanently enabled).*

**Input Filtering and External Capacitance:** Figure E provides a diagram showing the internal input filter components. This filter dramatically reduces input terminal ripple current, which otherwise could exceed the rating of the converter's external electrolytic input capacitor. The recommended external input capacitance

is specified in the Input Characteristics section on the Electrical Characteristics page. More detailed information is available in the application note titled "EMI Characteristics" on the SynQor website.

*Figure E: Internal Input Filter Diagram*

**MCOTS-C-270-3R3-QT**

**Output: 3.3V**

**Current: 30A**

**Application Section**

**Startup Inhibit Period:** The Startup Inhibit Period ensures that the converter will remain off for approximately 200 ms when it is shut down for any reason. When an output short is present, this generates a 5 Hz "hiccup" mode, which prevents the converter from overheating. In all, there are seven ways that the converter can be shut down, initiating a Startup Inhibit Period:

- Input Under-Voltage Lockout
- Input Over-Voltage Lockout
- Output Over-Voltage Protection
- Over Temperature Shutdown
- Current Limit
- Short Circuit Protection
- Turned off by the ON/OFF input

Figure F shows three turn-on scenarios, where a Startup Inhibit Period is initiated at  $t_0$ ,  $t_1$ , and  $t_2$ :

Before time  $t_0$ , when the input voltage is below the UVL threshold, the unit is disabled by the Input Under-Voltage Lockout feature. When the input voltage rises above the UVL threshold, the Input Under-Voltage lockout is released, and a Startup Inhibit Period is initiated. At the end of this delay, the ON/OFF pin is evaluated, and since it is active, the unit turns on.

At time  $t_1$ , the unit is disabled by the ON/OFF pin, and it cannot be enabled again until the Startup Inhibit Period has elapsed.

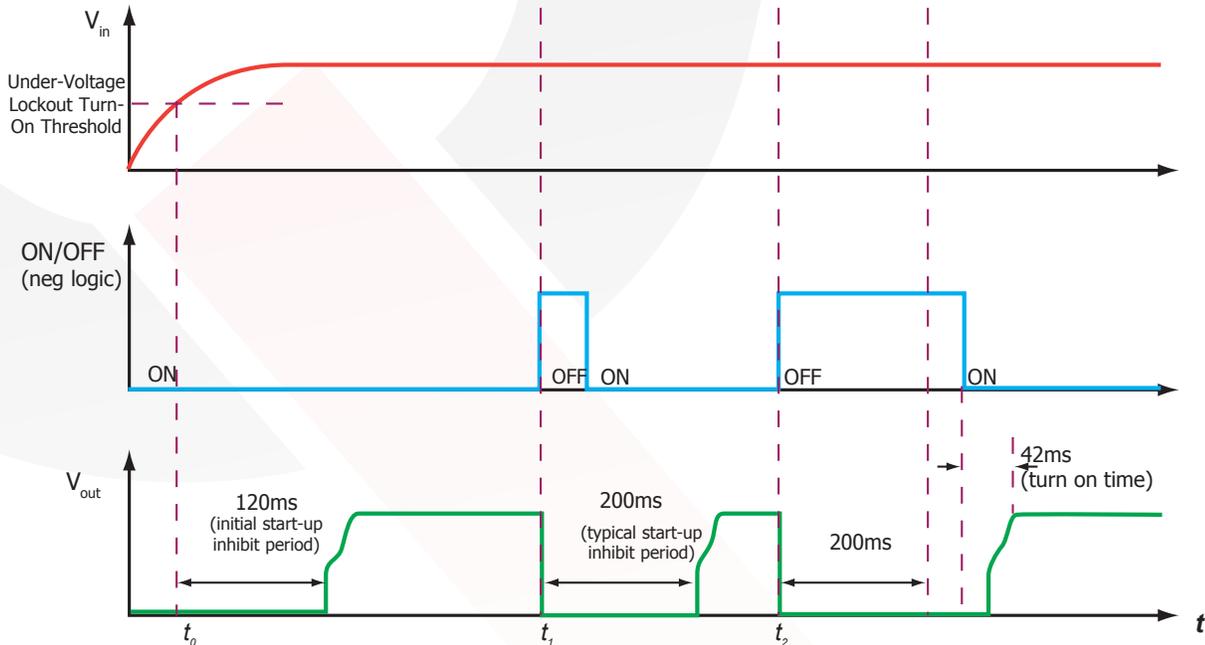

When the ON/OFF pin goes high after  $t_2$ , the Startup Inhibit Period has elapsed, and the output turns on within the typical Turn-On Time.

**Thermal Considerations:** The maximum operating base-plate temperature,  $T_{Bp}$ , is 100 °C. Refer to the thermal derating curve, Figure 5, to see the available output current at baseplate temperatures below 100 °C.

A power derating curve can be calculated for any heatsink that is attached to the base-plate of the converter. It is only necessary to determine the thermal resistance,  $R_{TH_{BA}}$ , of the chosen heatsink between the base-plate and the ambient air for a given airflow rate. This information is usually available from the heatsink vendor. The following formula can then be used to determine the maximum power the converter can dissipate for a given thermal condition:

$$P_{diss}^{max} = \frac{T_B - T_A}{R_{TH_{BA}}}$$

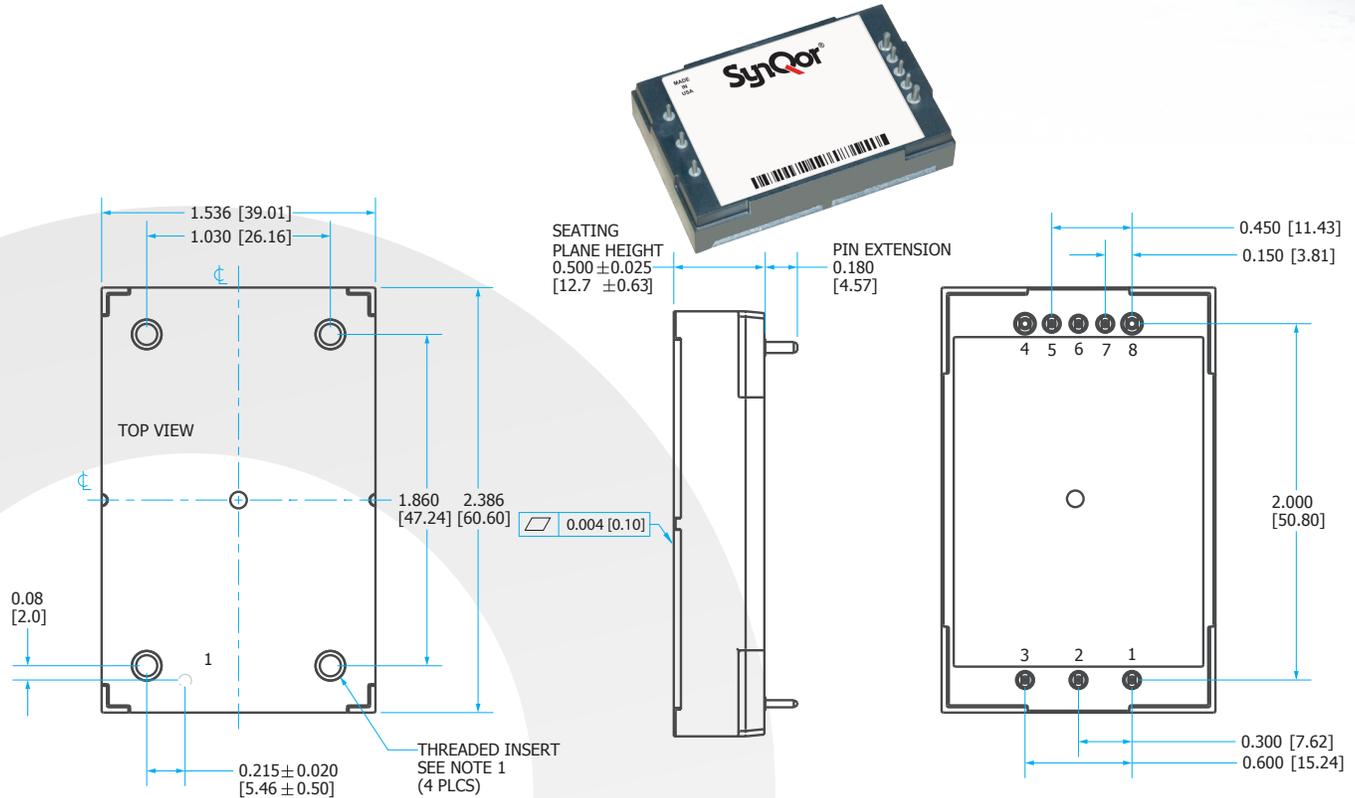

This value of power dissipation can then be used in conjunction with the data shown in Figure 3 to determine the maximum load current (and power) that the converter can deliver in the given thermal condition.

**Figure F:** Startup Inhibit Period (turn-on time not to scale)

## Standard Mechanical Drawing

### Mechanical Drawing – Normal Thermal Design Option

#### NOTES

- 1) M3 screws used to bolt unit's baseplate to other surfaces (such as a heatsink) must not exceed 0.100" (2.54 mm) depth below the surface of the baseplate.
- 2) Applied torque per screw should not exceed 6in-lb (0.7 Nm).
- 3) Baseplate flatness tolerance is 0.004" (.10mm) TIR for surface.
- 4) Pins 1-3, 5-7 are 0.040" (1.02mm) diameter, with 0.080" (2.03mm) diameter standoff shoulders.
- 5) Pins 4 and 8 are 0.062" (1.57 mm) diameter with 0.100" (2.54 mm) diameter standoff shoulders.
- 6) All Pins: Material – Copper Alloy; Finish – Matte Tin over Nickel plate
- 7) Undimensioned components are shown for visual reference only.
- 8) Weight: 3.2 oz. (91 g) typical
- 9) All dimensions in inches (mm)  
 Tolerances: x.xx +/-0.02 in. (x.x +/-0.5mm)  
 x.xxx +/-0.010 in. (x.xx +/-0.25mm)
- 10) Workmanship: Meets or exceeds IPC-A610 Class II

#### PIN DESIGNATIONS

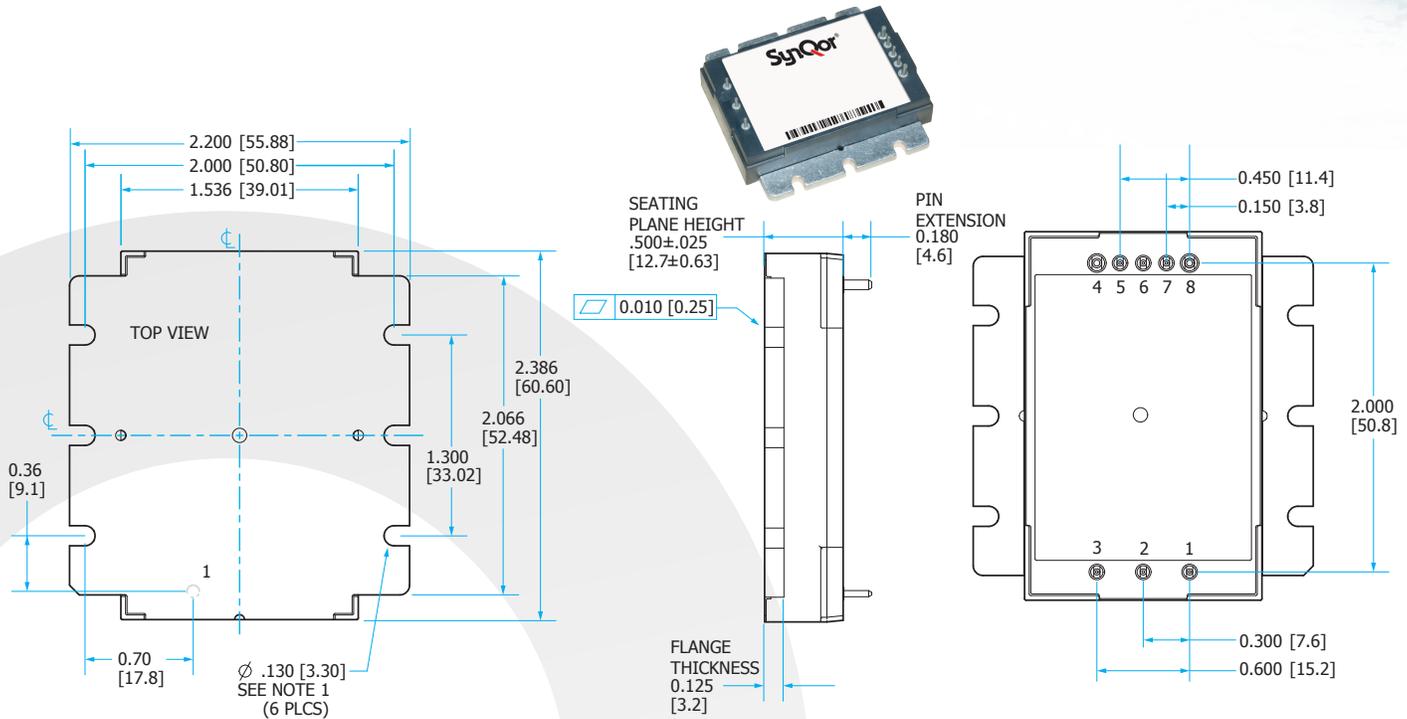

Pin	Label	Name	Function
1	+VIN	Vin(+)	Positive input voltage
2	ON/OFF	ON/OFF	TTL input to turn converter on and off, referenced to Vin(-), with internal pull up.
3	IN RTN	Vin(-)	Input return
4	OUT RTN	Vout(-)	Output return
5	-SNS	SENSE(-)	Negative remote sense <sup>1</sup>
6	TRIM	TRIM	Output voltage trim <sup>2</sup>
7	+SNS	SENSE(+)	Positive remote sense <sup>3</sup>
8	+VOUT	Vout(+)	Positive output voltage

#### Notes:

- 1) SENSE(-) should be connected to Vout(-) either remotely or at the converter.
- 2) Leave TRIM pin open for nominal output voltage.
- 3) SENSE(+) should be connected to Vout(+) either remotely or at the converter.

## Flanged Mechanical Drawing

### Mechanical Drawing – Flanged Thermal Design Option

#### NOTES

- 1) Applied torque per screw should not exceed 6in-lb (0.7 Nm).
- 2) Baseplate flatness tolerance is 0.010" (.25mm) TIR for surface.
- 3) Pins 1-3, 5-7 are 0.040" (1.02mm) diameter, with 0.080" (2.03mm) diameter standoff shoulders.
- 4) Pins 4 and 8 are 0.062" (1.57mm) diameter with 0.100" (2.54mm) diameter standoff shoulders.
- 5) All Pins: Material - Copper Alloy; Finish - Matte Tin over Nickel plate
- 6) Weight: 3.5 oz. (98 g) typical
- 7) Undimensioned components are shown for visual reference only.
- 8) All dimensions in inches (mm)  
Tolerances: x.xx +/-0.02 in. (x.x +/-0.5mm)  
x.xxx +/-0.010 in. (x.xx +/-0.25mm)
- 9) Workmanship: Meets or exceeds IPC-A610 Class II

#### PIN DESIGNATIONS - CONVERTER

Pin	Label	Name	Function
1	+VIN	Vin(+)	Positive input voltage
2	ON/OFF	ON/OFF	TTL input to turn converter on and off, referenced to Vin(-), with internal pull up.
3	IN RTN	Vin(-)	Input return
4	OUT RTN	Vout(-)	Output return
5	-SNS	SENSE(-)	Negative remote sense <sup>1</sup>
6	TRIM	TRIM	Output voltage trim <sup>2</sup>
7	+SNS	SENSE(+)	Positive remote sense <sup>3</sup>
8	+VOUT	Vout(+)	Positive output voltage

#### Notes:

- 1) SENSE(-) should be connected to Vout(-) either remotely or at the converter.
- 2) Leave TRIM pin open for nominal output voltage.
- 3) SENSE(+) should be connected to Vout(+) either remotely or at the converter.

Acceleration	513.6 - Procedure II	Operating: 15 g
Salt Fog	509.5	Storage
High Temperature	501.5 - Procedure I	Storage: 135 °C / 3 hrs
	501.5 - Procedure II	Operating: 100 °C / 3 hrs
Low Temperature	502.5 - Procedure I	Storage: -65 °C / 4 hrs
	502.5 - Procedure II	Operating: -55 °C / 3 hrs
Temperature Shock	503.5 - Procedure I - C	Storage: -65 °C to 135 °C; 12 cycles
Rain	506.5 - Procedure I	Wind Blown Rain
Immersion	512.5 - Procedure I	Non-Operating
Humidity	507.5 - Procedure II	Aggravated cycle @ 95% RH (Figure 507.5-7 aggravated temp - humidity cycle, 15 cycles)
Random Vibration	514.6 - Procedure I	10 - 2000 Hz, PSD level of 1.5 g <sup>2</sup> /Hz (54.6 g <sub>rms</sub> ), duration = 1 hr/axis
Shock	516.6 - Procedure I	20 g peak, 11 ms, Functional Shock (Operating no load) (saw tooth)
	516.6 - Procedure VI	Bench Handling Shock
Sinusoidal vibration	514.6 - Category 14	Rotary wing aircraft - helicopter, 4 hrs/axis, 20 g (sine sweep from 10 - 500 Hz)
Sand and Dust	510.5 - Procedure I	Blowing Dust
	510.5 - Procedure II	Blowing Sand

**MCOTS-C-270-3R3-QT**

**Output: 3.3V**

**Current: 30A**

**Ordering Information**

**Ordering Information/ Part Numbering**

Example MCOTS-C-270-3R3-QT-N-S

Not all combinations make valid part numbers, please contact SynQor for availability.

Family	Product	Input Voltage	Output Voltage	Package	Thermal Design	Screening Level	Options
MCOTS	C: Converter	<b>28:</b> 16-40V <b>28V:</b> 9-40V <b>28VE:</b> 9-70V <b>48:</b> 34-75V <b>270:</b> 155-425V	<b>1R8:</b> 1.8V <b>3R3:</b> 3.3V <b>05:</b> 5.0V <b>07:</b> 7.0V <b>12:</b> 12V <b>15:</b> 15V <b>24:</b> 24V <b>28:</b> 28V <b>48:</b> 48V	QT: Quarter Brick	<b>N:</b> Normal Threaded <b>F:</b> Flanged	<b>S:</b> S-Grade <b>M:</b> M-Grade	[ ]: Standard Feature

**APPLICATION NOTES**

A variety of application notes and technical white papers can be downloaded in PDF format from our [website](#).

**Contact SynQor for further information and to order:**

**Phone:** 978-849-0600  
**Toll Free:** 888-567-9596  
**Fax:** 978-849-0602  
**E-mail:** [power@synqor.com](mailto:power@synqor.com)  
**Web:** [www.synqor.com](http://www.synqor.com)  
**Address:** 155 Swanson Road  
 Boxborough, MA 01719  
 USA

**PATENTS**

SynQor holds numerous U.S. patents, one or more of which apply to most of its power conversion products. Any that apply to the product(s) listed in this document are identified by markings on the product(s) or on internal components of the product(s) in accordance with U.S. patent laws. SynQor's patents include the following:

6,896,526    6,927,987    7,050,309    7,765,687  
 7,787,261    8,149,597    8,644,027

**WARRANTY**

SynQor offers a two (2) year limited warranty. Complete warranty information is listed on our website or is available upon request from SynQor.
