

MCOTS-F-28-T-H7

Transient Filter Half-Brick

MILITARY COTS EMI FILTER

-40V to +40V Continuous Input 30A

Output Current

40mΩ @ 100°C

Max. DC Resistance

>80dB @ 250kHz
Differential Attenuation

FULL POWER OPERATION: -55°C to +100°C

The Mil-COTS series of EMI filters brings SynQor's field proven technology and manufacturing expertise to the military and aerospace industry. SynQor's innovative packaging approach ensures survivability in the most hostile environments. Compatible with the industry standard format, these filters have high differential-mode and common-mode attenuation, low DC resistance, and a stabilizing bulk capacitor resistor. They follow conservative component derating guidelines and they are designed and manufactured to comply with a wide range of military standards. This filter, when combined with Mil-COTS DC-DC converters, is designed to comply with MIL-STD-704, MIL-STD-1275, RTCA/DO-160, DEF-STAN 61-5 and MIL-STD-461 for a 28Vin system.

Operational Features

- Transient suppression circuitry to block voltage surges and spikes
- Soft-Start circuitry to limit in-rush charging currents
- Reverse polarity protection with a low-loss synchronous rectifier
- Output power limit for short-circuit protection
- ON/OFF pass-through circuitry
- Standby circuitry to minimize quiescent power draw
- 30 amps output current
- Very low DC resistance
- > 80 dB differential-mode attenuation at 250kHz
- > 36 dB common-mode attenuation at 250kHz
- Stabilizing bulk capacitor and damping resistor included
- All capacitors are X7R multi-layer ceramic
- Designed to meet most MIL-STD 461 EMI requirements

In-Line Manufacturing Process

- AS9100 and ISO 9001 Certified Facility
- Full component traceability

Mechanical Features

- Size: 2.49" x 2.39" x 0.51" (63.1 x 60.6 x 13.0 mm)
- Total weight: 4.6 oz. (130 g)
- Flanged baseplate version available

MilCOTS

Designed and Manufactured in the USA

Safety Features

- 2250V input/output to common mode isolation
- Certified 60950-1, 2nd Edition

Specification Compliance

MCOTS filters (with MCOTS converters) are designed to meet:

- MIL-HDBK-704-8 (A through F)
- RTCA/DO-160 Section 16, 17, 18
- MIL-STD-1275 (B, D) (Full power operation down to 16V_{IN})
- DEF-STAN 61-5 (part 6)/(5, 6)
- MIL-STD-461 (C, D, E, F)

Screening/Qualification

- Qualified to MIL-STD-810
- Available with S-Grade or M-Grade screening
- Pre-cap inspection per IPC-A-610, Class III
- Temperature cycling per MIL-STD-883, Method 1010, Condition B, 10 cycles
- Burn-In at 100 °C baseplate temperature
- Final visual inspection per MIL-STD-883, Method 2009

Electrical Characteristics Notes

- 1. Though beyond the continuous input voltage rating for MCOTS-28 Series Converters, these are within their transient input voltage ratings.
- 2. Verified by qualification testing and analysis.
- 3. Only the M grade products are tested at three temperatures. The S grade products are tested at one temperature. Please refer to the Mil-COTS Screening table for details.
- 4. Soft start is engaged only when the output voltage starts from zero or dips below the Turn-Off Output Voltage Threshold (4V max).
- 5. Shutdown and Restart if the input voltage goes below the UVLO value or above 84V.
- * Rs = Source Impedance

MCOTS-F-28-T-H1

Current: 30A

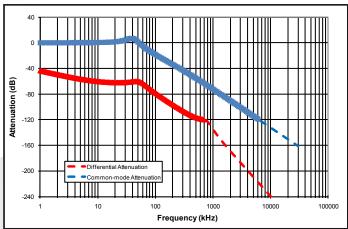

Figure 1: Calculated Common Mode and Differential Mode Attenuation provided by the filter as a function of frequency assuming no other parasitic coupling in the system. Both input lines are assumed to be connected to chassis ground through 50Ω resistors. The common-mode connection is also assumed to be connected to chassis ground.

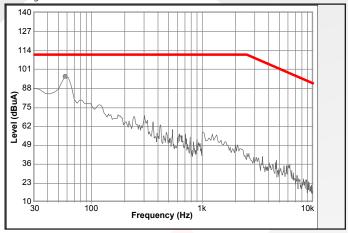

Figure 3: MIL-STD-461F Method CE101 Low Frequency Conducted Emissions. Limit line (in red) is the 'Submarine Applications DC Curve' for a 500W load. See MIL-STD-461 Compliance Matrix Table for test setup.

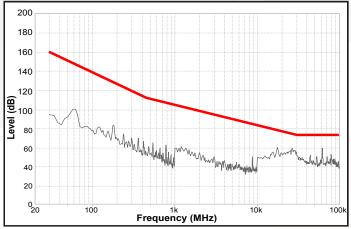

Figure 5: MIL-STD-461F Method RE101 Low Frequency Radiated Emissions. Limit line (in red) is the 'Standard Curve' from MIL-STD-461F Method RE01, which is more strict than all RE101 limits. See MIL-STD-461 Compliance Matrix Table for test setup.

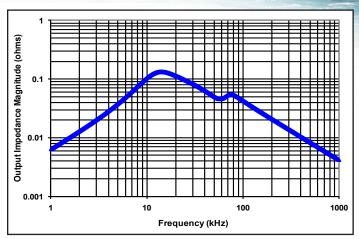

Figure 2: Typical Output Impedance (magnitude) of the filter looking back into its output pins with the input pins connected to a source with zero source impedance.

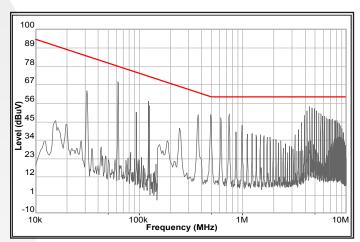

Figure 4: MIL-STD-461F Method CE102 High Frequency Conducted Emissions with two 33nF common mode capacitors. Limit line (in red) is the 'Basic Curve'. See MIL-STD-461 Compliance Matrix Table for test setup.

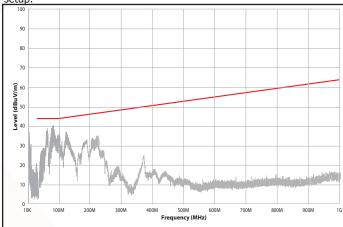

Figure 6: MIL-STD-461F Method RE102 High Frequency Radiated Emissions. Limit line (in red) is the 'Fixed Wing Internal, ≥ 25 meters Nose to Tail'. See MIL-STD-461 Compliance Matrix Table for test setup.

BASIC OPERATION AND FEATURES

The MCOTS-F-28-T is a multi-stage differential-mode and common-mode passive EMI filter designed to interface a power source with one or more SynQor DC/DC converters (or other loads that create EMI). Each stage of this filter is well damped to avoid resonances and oscillations, and only X7R multi-layer ceramic capacitors are used. Figure 1 shows the typical differential and common-mode attenuation provided by this filter when the source impedance is 50Ω to chassis ground on each input line.

The MCOTS-F-28-T EMI filter includes a large bulk capacitor (also X7R) with a series damping resistor to correct for the unstabilizing effect of a converter's negative input resistance. A white paper discussing this negative input resistance and the need for corrective damping can be found on the SynQor website (see Input System Instability application note). Figure 2 shows the magnitude of the filter's output impedance when the filter input is connected to a stiff voltage source.

When used with SynQor's DC/DC converters, the MCOTS-F-28-T EMI filter is designed to pass all the relevant MIL-STD-461D/E requirements to their most stringent limits. The MIL-STD-461 Compliance Matrix Table lists these requirements and describes the setup used to pass them. Figures 3 - 6 show results from selected conductive and radiated emissions tests.

TRANSIENT SUPPRESSION: The input voltage surge and spike compliance matrix displays the worst case requirements listed in various 28V Military (Vehicle and Aircraft) and Civil Aircraft standards. The MCOTS-F-28-T EMI filter is designed to handle all of the short duration voltage spike requirements of these standards (with certain assumptions regarding DEF-STAN 61-5). Some of the long duration voltage surge requirements remain within the 50V maximum transient rating of a SynQor MCOTS-C-28 DC/DC converter. The others require the transient suppression circuitry of the MCOTS-F-28-T EMI filter to protect the converter from an over-voltage condition. If MCOTS-C-28E or MCOTS-C-28VE converters are used, voltage surges as high as 80V can be tolerated without the need for this transient suppression circuitry.

The MCOTS-F-28-T EMI filter is also designed to pass the waveform types and applications specified in RTCA/DO-160E Section 22 (Lightning Induced Transient Susceptibility) to Level 4.

REVERSE POLARITY PROTECTION: The MCOTS-F-28-T EMI filter has a series-connected MOSFET that is controlled to function as a diode, but with a very small forward voltage drop ($\leq 4~\text{m}\Omega~\text{x}$ Iout). This "Synchronous Rectifier" blocks reverse current flow if the filter's input voltage is mistakenly connected with the wrong polarity. The anti-parallel diode, working with the synchronous rectifier, ensures that the filter's output voltage goes only slightly negative during this time, and therefore satisfying the minimum input voltage specifications of SynQor's MCOTS converters.

The synchronous rectifier also performs a useful function during negative polarity spikes and surges, and during brief power interrupts. Since it stops current from flowing negatively through the EMI filter back toward the source, the synchronous rectifier allows the total bulk capacitor (located both within and external to the filter) to better hold up the output voltage during these transients.

ON/OFF: The MCOTS-F-28-T filter has enable pass-through circuitry that bridges an enable signal across the filter's common-mode impedance. The ON/OFF INPUT pin (pin B) is referenced with respect to the filter's INPUT RETURN (pins 3 and 4). The ON/OFF OUTPUT pin (pin 8) is referenced with respect to the filter's OUTPUT RETURN (pin 5). The INPUT RETURN and OUTPUT RETURN may have a different voltage due to common-mode noise and transients.

NOTE: During the time that the MCOTS-F-28-T filter is in its Soft-Start mode the ON/OFF OUTPUT will be held at a logic low. This is done so that all of the filter's loads can be disabled by this signal during the Soft-Start period. Once the Soft-Start is completed, ON/OFF OUTPUT will follow ON/OFF INPUT.

Figure A shows the equivalent circuit looking into ON/OFF INPUT. The ON/OFF INPUT pin must be pulled low to turn an MCOTS converter off. It may be left open-circuit to turn the converter on.

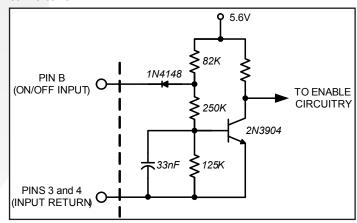

Figure A: Equivalent circuit looking into the ON/OFF INPUT pin with respect to the INPUT RETURN pin.

Figure B shows the equivalent circuit looking into ON/OFF OUTPUT. The n-channel MOSFET in this circuit turns on when power is applied to the filter and ON/OFF INPUT is low. Otherwise, the MOSFET is off. Standard MCOTS converters are enabled when their ON/OFF pin is held low. To interface the enable output of the MCOTS-F-28-T filter with MCOTS converters, add a N-type MOSFET as shown in the typical connection diagram. For improved noise tolerance, a seperate MOSFET can be used for each MCOTS converter, with their gates isolated from each other with sense resistors.

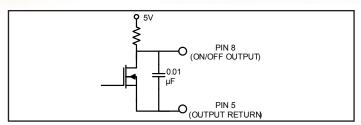

Figure B: Equivalent circuit looking into the ON/OFF OUTPUT pin with respect to the OUTPUT RETURN pin.

If the enable pass-through circuit is not being used, the ON/OFF INPUT pin may be left open or connected to the INPUT RETURN pins.

SOFT-START: The MCOTS-F-28-T filter incorporates Soft-Start circuitry to limit the amount of current drawn from the power source by the charging of large bulk capacitors at the filter's output.

Once the input voltage exceeds the turn-on threshold value, the Soft-Start circuitry controls the filter's output current to be approximately 1.8A. This mode of operation continues until the filter's output voltage reaches the input voltage, at which time the filter is able to deliver its rated output current. If after the Soft-Start duration period the filter's output has not risen to the input voltage, then the filter will disconnect the output from the input, wait for a time equal to the Soft-Start recycle period, and initiate a new Soft-Start.

Since, during Soft-Start, the filter will deliver only 1.8A to its output, it is important to limit the load current so that the total bulk capacitance can be fully charged before the Soft-Start duration period is over. To facilitate this, the filter's ON/OFF OUTPUT pin is held low during the Soft-Start mode. This signal can therefore be used to disable the filter's loads during this time. Once the Soft-Start mode is completed, ON/OFF OUTPUT will follow ON/OFF INPUT.

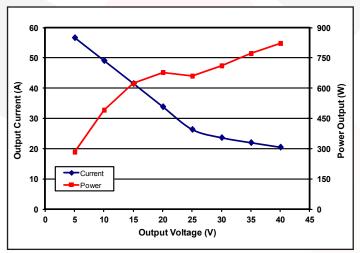

Figure C: Output Power Limit.

OUTPUT POWER LIMIT: The MCOTS-F-28-T filter has an output power limit feature to protect against a short circuit at its output pins. This limit is disabled whenever the output voltage is rising so that it will not be encountered when charging output capacitance. When the output power exceeds ~675W and its output voltage is decreasing however, this feature will turn the filter off and reinstitute a soft-start cycle in 500ms. Figure C shows the output power limit threshold as a function of output voltage.

STANDBY: The MCOTS-F-28-T filter has standby circuitry that minimizes the power drawn from the filter's input power source when the standby feature is activated.

It does this in two ways. First, the output of the filter is disconnected from the input so that there will be no power drawn by downstream converters or other loads. Second, the active circuitry within the filter is placed into a reduced power consumption mode. The net result is a current draw of only about 2mA from a 28V input power source.

Figure D shows the equivalent circuit looking into the STANDBY pin (pin 6).

This pin is referenced with respect to the filter's OUTPUT RETURN pin (pin 5). It should be pulled low to have the filter operate in its normal mode. If the pin is instead left open-circuit and pulled high by its internal circuitry, the standby feature will be activated.

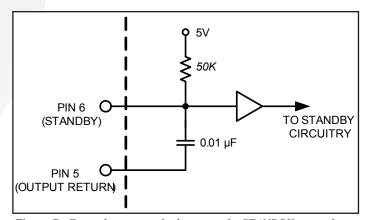

Figure D: Equivalent circuit looking into the STANDBY pin with respect to the OUTPUT RETURN pin.

Application Note: A typical application would place the MCOTS filter close to the input of the DC/DC converter, with the cases of the filter and the converter connected together through a ground plane. Both cases are electrically conductive, so connection to the cases can be made with the fasteners used to secure the device.

Do not connect the outputs of multiple MCOTS-F-28-T filters in parallel. Connecting filters in this manner may result in slightly unequal currents to flow in the positive and return paths of each filter. These unequal currents may cause the internal common-mode chokes to saturate and thus cause degraded common-mode rejection performance.

INPUT OVER VOLTAGE SHUTDOWN: To protect itself from damage due to sustained excessive power dissipation, the filter will shut down if the input voltage versus time exceeds the envelope in Figure E.

During this shutdown, power flow to the load is interrupted and the filter's ON/OFF OUTPUT pin is pulled LOW. When the input voltage returns to normal limits (and a Soft-Start Recycle Period has elapsed), the filter automatically begins a Soft-Start cycle.

All of the surges listed in the VOLTAGE SURGE AND SPIKE COMPLIANCE MATRIX on page 11 fall below the Figure E envelope. Only the DEF STAN 61-5 (Part 6)/6 DIT08.B surge exceeds this envelope. During a DIT08.B surge the filter will shutdown and then automatically restart once the surge passes. This meets the requirements of DEF STAN 61-5 (Part 6)/6 at Performance Criterion C while the DIT08.B test requires only Performance Criterion D.

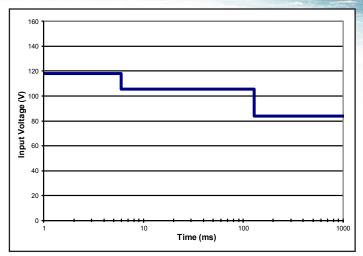

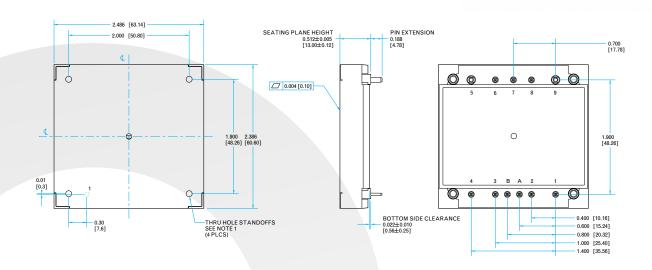

Figure E: Input over voltage shutdown envelope.

Mechanical Drawing

NOTES

- 1) Applied torque per M3 screw should not exceed 6in-lb (0.7 Nm). For non-threaded standoffs, internal diameter 0.125" (3.18 mm)
- 2) Baseplate flatness tolerance is 0.004" (.10mm) TIR for surface.
- 3) Pins 1-4,6-8, A, and B are 0.040" (1.02mm) diameter, with 0.080" (2.03mm) diameter standoff shoulders.
- 4) Pins 5 and 9 are 0.080" (2.03 mm) diameter with 0.125" (3.18 mm) diameter standoff shoulders.
- 5) All Pins: Material Copper Alloy; Finish Matte Tin over Nickel plate
- 6) Undimensioned components are shown for visual reference only.
- 7) Weight: 4.6 oz. (130 g) typical
- 8) Threaded or Non-Threaded options available
- 9) All dimensions in inches (mm)

Tolerances: x.xx +/-0.02 in. (x.x +/-0.5mm)

x.xxx +/-0.010 in. (x.xx +/-0.25mm)

10) Workmanship: Meets or exceeds IPC-A610 Class II

MCOTS-F-28-T-H7

Current: 30A

Flanged Mechanical Drawing

NOTES

- 1) Applied torque per M3 or 4-40 screw should not exceed 6in-lb (0.7 Nm).
- 2) Baseplate flatness tolerance is 0.010" (.2mm) TIR for surface.
- 3) Pins 1-4,6-8, A, and B are 0.040" (1.02mm) diameter, with 0.080" (2.03mm) diameter standoff shoulders.
- 4) Pins 5 and 9 are 0.080" (2.03 mm) diameter with 0.125" (3.18 mm) diameter standoff shoulders.
- 5) All Pins: Material Copper Alloy; Finish Matte Tin over Nickel plate
- 6) Undimensioned components are shown for visual reference only.
- 7) Weight: 4.8 oz. (136 g) typical
- 8) All dimensions in inches (mm)

Tolerances: x.xx +/-0.02 in. (x.x +/-0.5mm)

x.xxx +/-0.010 in. (x.xx +/-0.25mm)

9) Workmanship: Meets or exceeds IPC-A610 Class II

	(Cat C)	80V / 100ms	N/A	
	[Cui c]	48V / 1s	11/17	

Met by any MCOTS Filter

Met by an MCOTS Filter having the Transient Suppression and Reverse Polarity Protection Features

- § These are defined as the maximum disturbances that equipment can inflict upon the power system, not as disturbances imposed upon utilization equipment. To ensure compatablitily, however, these are within the designed stress envelope of the indicated filters & converters.
- † For the DEF STAN 61-5 specification:
 - 1) Negative surges require reverse voltage protection circuitry to protect the converter (but not the filter) from a negative input. This circuitry is included in the MCOTS-F-28-T but not the MCOTS-F-28-P filter.
 - 2) The negative surges may cause the converter to shut down unless additional holdup capacitance is included.
 - 3) Maximum spike voltages are assumed to last <1µs

^{*} Surge/spike requirements/limits are deemed to have been met as long as transient deviations in the converter's output voltage remain within ±10% of its initial value.

^{**} MCOTS-F-28-T filter only: Performance Criteria C. Filter will shut down and then automatically restart when the voltage returns to normal limits.

MIL-STD-461 COMPLIANCE MATRIX

This table shows the MIL-STD-461 requirements/limits that have been met* by a stand-alone setup comprised of:

- MCOTS-F-28-T Filter
- MCOTS-C-28-12-HZ DC/DC Converter
- 500W Resistive Load
- Metal Chassis Plane

		-461D/E
	Requirement	Most Stringent Limit Listed
Conducted Emissions	CE101 CE102	Submarine Basic Curve
Conducted Susceptibility	CS101 CS114 CS115 CS116	Curve #2 Curve #5 Basic Waveform I _{MAX} = 10A
Radiated Emissions	RE101 RE102 [†]	Navy Fixed Wing Internal, >25 meters Nose-to-Tail

^{*} Susceptibility requirements/limits are deemed to have been met as long as transient deviations in the converter's output voltage remain within $\pm 10\%$ of its initial value

Phone 1-888-567-9596 Doc.# 005-IH01196 Rev. J 12/06/18

[†] Met with common-mode capacitors and a metal screen shield covering the filter, converter, and resistive load.

Current: 30A

Mil-COTS Qualification

	Ţ		
Test Name	Details	# Tested (# Failed)	Consistent with MIL-STD-883F Method
Life Testing	Visual, mechanical and electrical testing before, during and after 1000 hour burn-in @ full load		Method 1005.8
Shock-Vibration	Visual, mechanical and electrical testing before, during and after shock and vibration tests	5 (0)	MIL-STD-202, Methods 201A & 213B
Humidity +85 °C, 95% RH, 1000 hours, 2 minutes on / 6 hours off		8 (0)	Method 1004.7
Temperature 500 cycles of -55 °C to +100 °C Cycling (30 minute dwell at each temperature)		10 (0)	Method 1010.8, Condition A
Solderability 15 pins		15 (0)	Method 2003
DMT	-65 °C to +110 °C across full line and load specifications in 5 °C steps		
Altitude	70,000 feet (21 km), see Note	2 (0)	

Note: A conductive cooling design is generally needed for high altitude applications because of naturally poor convective cooling at rare atmospheres.

Mil-COTS Converter and Filter Screening

Screening	Process Description	S-Grade	M-Grade
Baseplate Operating Temperature		-55 °C to +100 °C	-55 °C to +100 °C
Storage Temperature		-65 °C to +135 °C	-65 °C to +135 °C
Pre-Cap Inspection	IPC-A-610, Class III	•	•
Temperature Cycling	MIL-STD-883F, Method 1010, Condition B, 10 Cycles		•
Burn-In	100 °C Baseplate	12 Hours	96 Hours
Final Electrical Test	100%	25 °C	-55 °C, +25 °C, +100 °C
Final Visual Inspection	MIL-STD-883F, Method 2009	•	•

STANDARDS COMPLIANCE

Parameter Notes & Conditions

STANDARDS COMPLIANCE	
UL 60950-1	Basic Insulation
CAN/CSA C22.2 No. 60950-1	
EN 60950-1	

Note: An external input fuse must always be used to meet these safety requirements.

Contact SynQor for official safety certificates on new releases or download from the SynQor website.

PATENTS

SynQor holds numerous U.S. patents, one or more of which apply to most of its power conversion products. Any that apply to the product(s) listed in this document are identified by markings on the product(s) or on internal components of the product(s) in accordance with U.S. patent laws. SynQor's patents include the following:

6,545,890 6,594,159 6,894,468 6,896,526 6,927,987 7,050,309 7,085,146 7,119,524 7,765,687 7,787,261 8,149,597 8,644,027

Warranty

SynQor offers a two (2) year limited warranty. Complete warranty information is listed on our website or is available upon request from SynQor.
