

# MQHE-28E-P Passive Filter

## HIGH RELIABILITY EMI FILTER

<b>-70V to +70V</b> Continuous Input	<b>10A</b> Output Current	<b>60mΩ @ 125°C</b> Max. DC Resistance	<b>&gt;80dB @ 500kHz</b> Differential Attenuation
---	------------------------------	---	--

**FULL POWER OPERATION: -55°C to +125°C**

The MilQor® series of high-reliability EMI filters brings SynQor's field proven technology and manufacturing expertise to the Military/Aerospace industry. SynQor's innovative QorSeal® packaging approach ensures survivability in the most hostile environments. Compatible with the industry standard format, these filters have high differential-mode and common-mode attenuation, low DC resistance, and a stabilizing bulk capacitor resistor. They follow conservative component derating guidelines and they are designed and manufactured to comply with a wide range of military standards.

DESIGNED & MANUFACTURED IN THE USA  
FEATURING QORSEAL® HI-REL ASSEMBLY

### Design Process

MQHE series filters are:

- Designed for reliability per NAVSO-P3641-A guidelines
- Designed with components derated per:
  - MIL-HDBK-1547A
  - NAVSO P-3641A

### Qualification Process

MQHE series filters are qualified to:

- MIL-STD-810F
  - consistent with RTCA/DO-160E
- SynQor's First Article Qualification
  - consistent with MIL-STD-883F
- SynQor's Long-Term Storage Survivability Qualification
- SynQor's on-going life test

### In-Line Manufacturing Process

- AS9100 and ISO 9001 certified facility
- Full component traceability
- Temperature cycling
- Constant acceleration
- 24, 96, 160 hour burn-in
- Three level temperature screening

### Features

- 10 amps output current
- Very low DC resistance
- > 80 dB differential-mode attenuation at 500kHz
- > 60 dB common-mode attenuation at 500kHz
- Stabilizing bulk capacitor and damping resistor included
- All capacitors are X7R multi-layer ceramic
- Designed to meet all MIL-STD 461 EMI and most RTCA/DO-160E Section 22 lightning requirements

### Specification Compliance

MQHE series filters (with MQHL converters) are designed to meet:

- MIL-HDBK-704-8 (A through F)
- RTCA/DO-160E Section 16
- MIL-STD-1275D for Vin > 16V
- DEF-STAN 61-5 (part 6)/5 for Vin > 16V
- MIL-STD-461 (C, D, E, F)
- RTCA/DO-160E Section 22

### Electrical Characteristics Notes

1. While the filter will survive these input voltage limits, the filter's output voltage will be outside the limits for an MQHL converter input voltage range.
2. Verified by qualification testing and analysis.
3. Only the ES and HB grade products are tested at three temperatures. The C grade products are tested at one temperature. Please refer to the Construction and Environmental Stress Screening Options table for details.
4. The specified operating case temperature for ES grade products is -45°C to 100°C. The specified operating case temperature for C grade products is 0°C to 70°C.

**Technical Specification**

**Figure 1:** Simulation of calculated common-mode and differential-mode current attenuation. The curves plot the ratio of noise current in a 50Ω LISN sensing port connected to the noise output side of the filter to the noise current on the input side. The filter case is also connected to chassis ground. Refer to Figures A and B.

**Figure 2:** Typical Output Impedance (magnitude) of the filter looking back into its output pins with the input pins connected to a source with zero source impedance.

**Figure 3:** MIL-STD-461E Method CE101 Low Frequency Conducted Emissions of the MQHE-28-P filter with a MQHL-28-05S at 50W output. Limit line (in red) is the 'Submarine Applications DC Curve'.

**Figure 4:** MIL-STD-461E Method CE102 High Frequency Conducted Emissions of the MQHE-28-P filter with a MQHL-28-05S at 50W output. Limit line (in red) is the 'Basic Curve'.

**Figure 5:** MIL-STD-461E Method RE101 Low Frequency Radiated Emissions of the MQHE-28-P filter with a MQHL-28-05S at 50W output. Limit line (in red) is the 'Standard Curve' from MIL-STD-461C Method RE01, which is more strict than all RE101 limits.

**Figure 6:** MIL-STD-461E Method RE102 High Frequency Radiated Emissions of the MQHE-28-P filter with a MQHL-28-05S at 50W output. Limit line (in red) is the 'Submarine External to Pressure Hull Curve'.

## BASIC OPERATION AND FEATURES

The MQHE is a multi-stage differential-mode and common-mode passive EMI filter designed to interface a power source with one or more SynQor DC/DC converters (or other loads that create EMI). Each stage of this filter is well damped to avoid resonances and oscillations, and only X7R multi-layer ceramic capacitors are used. Figure 1 shows the typical differential and common-mode attenuation provided by this filter when the source impedance is  $50\Omega$  to chassis ground on each input line.

The MQHE EMI filter includes a large bulk capacitor (also X7R) with a series damping resistor to correct for the unstabilizing effect of a converter's negative input resistance. A white paper discussing this negative input resistance and the need for corrective damping can be found on the SynQor website (see Input System Instability application note). Figure 2 shows the magnitude of the filter's output impedance when the filter input is connected to a stiff voltage source.

The input voltage surge and spike compliance matrix displays the worst case requirements listed in various 28V Military (Vehicle and Aircraft) and Civil Aircraft standards. The MQHE EMI filter is designed to handle all of the short duration voltage spike requirements of these standards (with certain assumptions regarding DEF-STAN 61-5). Some of the long duration voltage surge requirements remain within the 50V maximum transient rating of a SynQor MQHL-28 DC/DC converter.

When used with SynQor's DC/DC converters, the MQHE EMI filter is designed to pass all of the relevant MIL-STD-461C/D/E/F requirements to their most stringent limits. The MIL-STD-461 Compliance Matrix Table lists these requirements and describes the setup used to pass them. Figures 3 - 6 show results from selected conductive and radiated emissions tests.

The filter is also designed to pass the waveform types and applications specified in RTCA/DO-160E Section 22 (Lightning Induced Transient Susceptibility) to Level 4. The Section 22 Compliance Matrix Table lists these waveforms and applications and describes the setup used to pass them.

A typical application would place the MilQor filter close to the input of the DC/DC converter, with the cases of the filter and the converter connected together through a ground plane. Both cases are electrically conductive, so connection to the cases can be made with the fasteners used to secure the device.

Do not connect the outputs of multiple MQHE filters in parallel. Connecting filters in this manner may result in slightly unequal currents to flow in the positive and return paths of each filter. These unequal currents may cause the internal common-mode chokes to saturate and thus cause degraded common-mode rejection performance.

Figure A: Differential-Mode Current Attenuation,  $I_{meas} / I_{noise}$

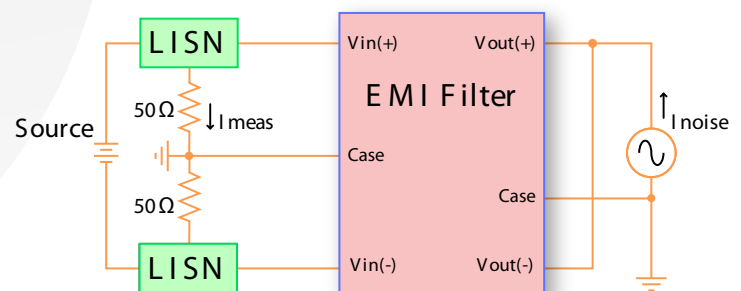

Figure B: Common-Mode Current Attenuation,  $I_{meas} / I_{noise}$

Single- and Multiple-Stroke Ground Injection	4	4	Signal applied between metal ground plane and system ground
	5a	4	
Multiple-Burst Cable Induction	3	4	Signal applied to unshielded power cable bundle

Met by any MQME/MQHE Filter	Met by an MQME Filter having the Transient Suppression and Reverse Polarity Protection Features
-----------------------------	---

\* Requirement is deemed to have been met as long as transient deviations in the converter’s output voltage remain within ±10% of its initial value.

† For these waveforms at Level 3 and above, an external transient suppressor of sufficient energy rating must be placed across the filter’s input pins to keep the differential transient input voltage below +200V/-50V. Negative polarity waveforms may cause power flow to the converter to be interrupted long enough to cause a graceful shutdown and restart of the converter. Also, the reverse voltage protection feature of the -T filter is required to protect the converter (but not the filter) from negative polarity waveform.

\*\* For this waveform at a Level 4 and above, external transient suppressors of sufficient energy rating must be added between the filter’s input power pins and its case to keep the common-mode transient input voltage below ±800V.

### Technical Specification

## VOLTAGE SURGE AND SPIKE COMPLIANCE MATRIX

These tables show the Voltage Surge and Spike requirements/limits that have been met\* by a stand-alone setup comprised of:

- MQME-28-P (or -T) Filter
- MQFL-28-05S DC/DC Converter
- 120W Resistive Load
- Metal Chassis Plane

Met by any Hi-Rel Filter

Met by an MQME-28-T Filter having the Transient Suppression and Reverse Polarity Protection Features

Met by MQME-28E-T6 Filter Only: Performance Criteria C

\* Surge/spike requirements/limits are deemed to have been met as long as transient deviations in the converter's output voltage remain within ±10% of its initial value.

§ These are defined as the maximum disturbances that equipment can inflict upon the power system, not as disturbances imposed upon utilization equipment. To ensure compatibility, however, these are within the designed stress envelope of the indicated filters & converters.

† For the DEF STAN 61-5 specification:

- 1) Negative surges require reverse voltage protection circuitry to protect the converter (but not the filter) from a negative input. This circuitry is included in the MQME-28-T but not the MQME-28-P and MQHE-28-P filters.
- 2) The negative surges may cause the converter to shut down unless additional holdup capacitance is included.
- 3) Maximum spike voltages are assumed to last <1µs

Construction Process			QorSeal	QorSeal

MilQor® Hi-Rel converters and filters are offered in three variations of environmental stress screening options. All ES-Grade and HB-Grade MilQor Hi-Rel converters use SynQor’s proprietary QorSeal® Hi-Rel assembly process that includes a Parylene-C coating of the circuit, a high performance thermal compound filler, and a nickel barrier gold plated aluminum case. Each successively higher grade has more stringent mechanical and electrical testing, as well as a longer burn-in cycle. The ES- and HB-Grades are also constructed of components that have been procured through an element evaluation process that pre-qualifies each new batch of devices.
