

PQ60033EGx20

48V Input 3.3V Output 20A Current 2000Vdc Isolation **Eighth-brick**DC-DC Converter

The PQ60033EGx20 PowerQor® Giga eighth-brick converter is a next-generation, board-mountable, isolated, fixed switching frequency DC/DC converter that uses synchronous rectification to achieve extremely high conversion efficiency. The power dissipated by the converter is so low that a heatsink is not required, which saves cost, weight, height, and application effort. All of the power and control components are mounted to the multi-layer PCB substrate with high-yield surface mount technology. Since the PowerQor converter has no explicit thermal interfaces, it is extremely reliable. RoHS compliant (see page 12).

Operational Features

- High efficiency, 89% at half load, >87% at full load
- Delivers up to 20 amps of output current (66W) with minimal derating - no heatsink required
- Wide input voltage range: 35V 75V, with 100V 100ms input voltage transient capability
- Fixed frequency switching provides predictable EMI performance
- No minimum load requirement means no preload resistors required

Mechanical Features

- Industry standard eighth-brick pin-out configuration
- Industry standard size: 0.90" x 2.3" (22.9x58.4 mm)
- Total height of the EGL is only 0.340" (8.64 mm), permitting better airflow and smaller card pitch
- Total weight: 0.68 oz (19 g)
- Open frame units have flanged pins designed to permit surface mount soldering (avoid wave solder) using FPiP technique

Control Features

- On/Off control referenced to input side (positive and negative logic options are available)
- Remote sense for the output voltage compensates for output distribution drops
- Output voltage trim permits custom voltages and voltage margining

PQ60033EGL20 Module

Protection Features

- Input under-voltage lockout disables converter at low input voltage conditions
- Output current limit and short circuit protection protects converter and load from permanent damage and consequent hazardous conditions
- Active back bias limit prevents damage to converter from external load induced pre-bias
- Output over-voltage protection protects load from damaging voltages
- Thermal shutdown protects converter from abnormal environmental conditions

Safety Features

- 2000V, 30 $M\Omega$ input-to-output isolation provides input/output ground separation
- UL 60950-1 recognized (US & Canada), basic insulation rating
- TUV certified to EN60950-1
- Meets 72/23/EEC and 93/68/EEC directives which facilitates CE Marking in user's end product
- Board and plastic components meet UL94V-0 flammability requirements

NOTES

- 1) Pins 1-3, 5-7 are 0.040" (1.02mm) diameter. with 0.080" (2.03mm) diameter standoff shoulders.
- 2) Pins 4 and 8 are 0.062" (1.57 mm) diameter with 0.100" (2.54 mm) diameter standoff shoulders.
- 3) Other pin extension lengths available. Recommended pin length is 0.03" (0.76mm) greater than the PCB thickness.
- 4) All Pins: Material: Copper Alloy

Finish (RoHS 6/6) - Matte Tin over Nickel plate

- 5) Undimensioned components are shown for visual reference only.
- 6) All dimensions in inches (mm)

Tolerances: x.xx + /-0.02 in. (x.x + /-0.5mm)

x.xxx + -0.010 in. (x.xx + -0.25mm)

- 7) Weight: 0.68 oz. (19 g) typical
- 8) Workmanship: Meets or exceeds IPC-A-610C Class II
- 9) Modules can be ordered as EGA option that have different pins to provide a minimum bottom side clearance of 0.076" while increasing maximum height to 0.424". See ordering page for more information.
- 10) The flanged pins are designed to permit surface mount soldering (allowing to avoid the wave soldering process) through the use of the flanged pin-in-paste technique.

PIN DESIGNATIONS

(2.26)

See Note 9

Pin No.	Name	Function	
1	Vin(+)	Positive input voltage	
2	ON/OFF	TTL input to turn converter on and off, referenced to Vin(-), with internal pull up.	
3	Vin(-)	Negative input voltage	
4	Vout(-)	Negative output voltage	
5	SENSE(-)	Negative remote sense ¹	
6	TRIM	Output voltage trim ²	
7	SENSE(+)	Positive remote sense ³	
8	Vout(+)	Positive output voltage	

Notes:

- 1. SENSE(-) should be connected to Vout(-) either remotely or at the converter.
- 2. Leave TRIM pin open for nominal output voltage.
- 3. SENSE(+) should be connected to Vout(+) either remotely or at the converter.)

BASIC OPERATION AND FEATURES

The PowerQor series converter uses a two-stage power conversion topology. The first stage is a buck-converter that keeps the output voltage constant over variations in line, load, and temperature. The second stage uses a transformer to provide the functions of input/output isolation and voltage step-down to achieve the low output voltage required.

Both the first stage and the second stage switch at a fixed frequency for predictable EMI performance. Rectification of the transformer's output is accomplished with synchronous rectifiers. These devices, which are MOSFETs with a very low on-state resistance, dissipate far less energy than Schottky diodes. This is the primary reason that the *PowerQor* converter has such high efficiency, even at very low output voltages and very high output currents.

Dissipation throughout the converter is so low that it does not require a heatsink for operation. Since a heatsink is not required, the *PowerQor* converter does not need a metal baseplate or potting material to help conduct the dissipated energy to the heatsink. The *PowerQor* converter can thus be built more simply and reliably using high yield surface mount techniques on a PCB substrate.

The *PowerQor* series of eighth-brick, quarter-brick and half-brick converters uses the industry standard footprint and pin-out configuration.

Figure A: Various circuits for driving the ON/OFF pin.

CONTROL FEATURES

REMOTE ON/OFF (Pin 2): The ON/OFF input, Pin 2, permits the user to control when the converter is *on* or *off*. This input is referenced to the return terminal of the input bus, Vin(-). There are two versions of the converter that differ by the polarity of the logic used for the ON/OFF input.

In the positive logic version, the ON/OFF input is active high (a high turns the converter on). In the negative logic version, the ON/OFF signal is active low (a low turns the converter on). Figure A details five possible circuits for driving the ON/OFF pin. Figure B is a detailed look of the internal ON/OFF circuitry.

REMOTE SENSE(\pm) (**Pins 7 and 5**): The SENSE(\pm) inputs correct for voltage drops along the conductors that connect the converter's output pins to the load.

Pin 7 should be connected to Vout(+) and Pin 5 should be connected to Vout(-) at the point on the board where regulation is desired. A remote connection at the load can adjust for a voltage drop only as large as that specified in this datasheet, that is

$$[Vout(+) - Vout(-)] - [Vsense(+) - Vsense(-)] \le$$

Sense Range % x Vout

Pins 7 and 5 must be connected for proper regulation of the output voltage. If these connections are not made, the converter will deliver an output voltage that is slightly higher than its specified value.

Note: The output over-voltage protection circuit senses the voltage across the output (pins 8 and 4) to determine when it should trigger, not the voltage across the converter's sense leads (pins 7 and 5). Therefore, the resistive drop on the board should be small enough so that output OVP does not trigger, even during load transients.

Figure B: Internal ON/OFF pin circuitry

PQ60033EGx20

OUTPUT VOLTAGE TRIM (Pin 6): The TRIM input permits the user to adjust the output voltage across the sense leads up or down according to the trim range specifications.

To decrease the output voltage, the user should connect a resistor between Pin 6 and Pin 5 (SENSE(-) input). For a desired decrease of the nominal output voltage, the value of the resistor should be

$$R_{\text{trim-down}} = \left(\frac{511}{\Delta\%}\right)^{-1} - 10.22 \text{ (k}\Omega)$$

where

$$\Delta\% = \begin{vmatrix} \frac{\text{Vnominal} - \text{Vdesired}}{\text{Vnominal}} \\ \times 100\%$$

To increase the output voltage, the user should connect a resistor between Pin 6 and Pin 7 (SENSE(+) input). For a desired increase of the nominal output voltage, the value of the resistor should be

$$R_{\text{trim-up}} = \left(\frac{5.11 V_{\text{OUT}} (100 + \Delta\%)}{1.225 \Delta\%} - \frac{511}{\Delta\%} - 10.22 \right) (k\Omega)$$

where

V_{OUT} = Nominal Output Voltage

Figure C graphs the relationship between the trim resistor value and Rtrim-up and Rtrim-down, showing the total range the output voltage can be trimmed up or down.

Figure C: Trim Graph for 3.3Vout module

<u>Note</u>: the TRIM feature does not affect the voltage at which the output over-voltage protection circuit is triggered. Trimming the output voltage too high may cause the over-voltage protection circuit to engage, particularly during transients.

It is not necessary for the user to add capacitance at the Trim pin. The node is internally bypassed to eliminate noise.

Total DC Variation of Vout: For the converter to meet its full specifications, the maximum variation of the DC value of Vout, due to both trimming and remote load voltage drops, should not be greater than that specified for the output voltage trim range.

PROTECTION FEATURES

Input Under-Voltage Lockout: The converter is designed to turn off when the input voltage is too low, helping avoid an input system instability problem, described in more detail in the application note titled "Input System Instability" available on the SynQor website. The lockout circuitry is a comparator with DC hysteresis. When the input voltage is rising, it must exceed the typical Turn-On Voltage Threshold value (listed on the specification page) before the converter will turn on. Once the converter is on, the input voltage must fall below the typical Turn-Off Voltage Threshold value before the converter will turn off.

Output Current Limit: The maximum current limit remains constant as the output voltage drops. However, once the impedance of the short across the output is small enough to make the output voltage drop below the specified Output DC Current-Limit Shutdown Voltage, the converter turns off.

The converter then enters a "hiccup mode" where it repeatedly turns on and off at a 5 Hz (nominal) frequency with a 5% duty cycle until the short circuit condition is removed. This prevents excessive heating of the converter or the load board.

Output Over-Voltage Limit: If the voltage across the output pins exceeds the Output Over-Voltage Protection threshold, the converter will immediately stop switching. This prevents damage to the load circuit due to 1) excessive series resistance in output current path from converter output pins to sense point, 2) a release of a short-circuit condition, or 3) a release of a current limit condition. Load capacitance determines exactly how high the output voltage will rise in response to these conditions. After 200 ms the converter will automatically restart.

Over-Temperature Shutdown: A temperature sensor on the converter senses the average temperature of the module. The thermal shutdown circuit is designed to turn the converter off when the temperature at the sensed location reaches the Over-Temperature Shutdown value. It will allow the converter to turn on again when the temperature of the sensed location falls by the amount of the Over-Temperature Shutdown Restart Hysteresis value.

PQ60033EGx20

APPLICATION CONSIDERATIONS

Input System Instability: This condition can occur because any DC/DC converter appears incrementally as a negative resistance load. A detailed application note titled "Input System Instability" is available on the SynQor website which provides an understanding of why this instability arises, and shows the preferred solution for correcting it.

Application Circuits: Figure D below provides a typical circuit diagram which details the input filtering and voltage trimming.

Input Filtering and External Capacitance: Figure E below provides a diagram showing the internal input filter components. This filter dramatically reduces input terminal ripple current, which otherwise could exceed the rating of an external electrolytic input capacitor. The recommended external input capacitance is specified in the "Input Characteristics" section. More detailed information is available in the application note titled "EMI Characteristics" on the SynQor website.

Figure D: Typical application circuit (negative logic unit, permanently enabled).

Figure E: Internal Input Filter Diagram (component values listed on page 3).

PQ60033EGx20

Startup Inhibit Period: The Startup Inhibit Period ensures that the converter will remain off for approximately 200ms when it is shut down for any reason. When an output short is present, this generates a 5Hz "hiccup mode," which prevents the converter from overheating. In all, there are seven ways that the converter can be shut down, initiating a Startup Inhibit Period:

- Input Under-Voltage Lockout
- Input Over-Voltage Shutdown (not present in Eighth-brick)
- Output Over-Voltage Protection
- Over Temperature Shutdown
- Current Limit
- Short Circuit Protection
- Turned off by the ON/OFF input

Figure F shows three turn-on scenarios, where a Startup Inhibit Period is initiated at t₀, t₁, and t₂:

Before time t_0 , when the input voltage is below the UVL threshold, the unit is disabled by the Input Under-Voltage Lockout feature. When the input voltage rises above the UVL threshold, the Input Under-Voltage Lockout is released, and a Startup Inhibit Period is initiated. At the end of this delay, the ON/OFF pin is evaluated, and since it is active, the unit turns on.

At time t₁, the unit is disabled by the ON/OFF pin, and it cannot be enabled again until the Startup Inhibit Period has elapsed.

When the ON/OFF pin goes high after t_2 , the Startup Inhibit Period has elapsed, and the output turns on within the typical Turn-On Time.

Figure F: Startup Inhibit Period (turn-on time not to scale)

PQ60033EGx20

PART NUMBERING SYSTEM

The part numbering system for SynQor's dc-dc converters follows the format shown in the example below.

The first 12 characters comprise the base part number and the last 3 characters indicate available options. Although there are no default values for enable logic and pin length, the most common options are negative logic and 0.145" pins. These part numbers are more likely to be readily available in stock for evaluation and prototype quantities. The "-G" suffix indicates 6/6 RoHS compliance.

Application Notes

A variety of application notes and technical white papers can be downloaded in pdf format from our website.

RoHS Compliance: The EU led RoHS (Restriction of Hazardous Substances) Directive bans the use of Lead, Cadmium, Hexavalent Chromium, Mercury, Polybrominated Biphenyls (PBB), and Polybrominated Diphenyl Ether (PBDE) in Electrical and Electronic Equipment. This SynQor product is 6/6 RoHS compliant. For more information please refer to SynQor's RoHS addendum available at our RoHS Compliance / Lead Free Initiative web page or e-mail us at rohs@synqor.com.

ORDERING INFORMATION

The tables below show the valid model numbers and ordering options for converters in this product family. When ordering SynQor converters, please ensure that you use the complete 15 character part number consisting of the 12 character base part number and the additional characters for options. Add "-G" to the model number for 6/6 RoHS compliance.

Model Number	Input Voltage	Output Voltage	Max Output Current
PQ60010EGw20xyz	35 - 75V	1.0V	20A
PQ60010EGw25xyz	35 - 75V	1.0V	25A
PQ60012EGw20xyz	35 - 75V	1.2V	20A
PQ60012EGw25xyz	35 - 75V	1.2V	25A
PQ60015EGw20xyz	35 - 75V	1.5V	20A
PQ60015EGw25xyz	35 - 75V	1.5V	25A
PQ60018EGw20xyz	35 - 75V	1.8V	20A
PQ60018EGw25xyz	35 - 75V	1.8V	25A
PQ60025EGw20xyz	35 - 75V	2.5V	20A
PQ60025EGw25xyz	35 - 75V	2.5V	25A
PQ60033EGw20xyz	35 - 75V	3.3V	20A
PQ60050EGw15xyz	35 - 75V	5.0V	15A
PQ60120EGw07xyz	35 - 75V	12V	6.25A
PQ60150EGw05xyz	35 - 75V	15V	5.0A
PQ60300EGw03xyz	35 - 75V	24V	3.0A

The following options must be included in place of the $w \times y \times z$ spaces in the model numbers listed above. Modules above can be ordered with an increased bottom side board clearance and a slightly larger total height (see page 2 for dimensions). To order replace EGL in the part number with EGA. There are no other differences from the EGL units.

Options Description: w x y z						
Thermal Design	Enable Logic	Pin Style	Feature Set			
A - Open Frame L - Low Profile Open Frame		K - 0.110" N - 0.145" R - 0.180" Y - 0.250"	S - Standard			

See the technical addendum on the Product Selector web page for additional specifications on the baseplated version of the PowerQor Mega & Giga Eighth-brick series of converters.

Not all combinations make valid part numbers, please contact SynQor for availability. See the Product Summary web page for more options.
