

MILITARY COTS DC/DC CONVERTER

240-280V Continuous Input	200-350V Transient Input	8V Output	50A Output	89% @ 25A / 88% @ 50A Efficiency
-------------------------------------	------------------------------------	---------------------	----------------------	--

Operation: -55°C to +100°C

The MilQor series of Mil-COTS DC/DC converters brings SynQor's field proven high-efficiency synchronous rectification technology to the Military/Aerospace industry. SynQor's ruggedized encased packaging approach ensures survivability in demanding environments. Compatible with the industry standard format, these converters operate at a fixed frequency, and follow conservative component derating guidelines. They are designed and manufactured to comply with a wide range of military standards.

Mil-COTS

Designed and Manufactured in the USA

Operational Features

- High efficiency, 88% at full rated load current
- Operating input voltage range: 240-280 V
- Fixed frequency switching provides predictable EMI
- No minimum load requirement

Mechanical Features

- Industry standard half-brick pin-out configuration
- Size: 2.49" x 2.39" x 0.51"
(63.1 x 60.6 x 13.0 mm)
- Total weight: 4.9 oz. (139 g)
- Flanged baseplate version available

Control Features

- On/Off control referenced to input return
- Remote sense for the output voltage
- Output voltage trim range of +10%, -10%
- Active current sharing (full feature option)
- Clock synchronization (full feature option)
- Start synchronization (full feature option)

Safety Features

- 4250V dc, 100 MΩ input-to-output isolation
- (see Standards and Qualifications page)

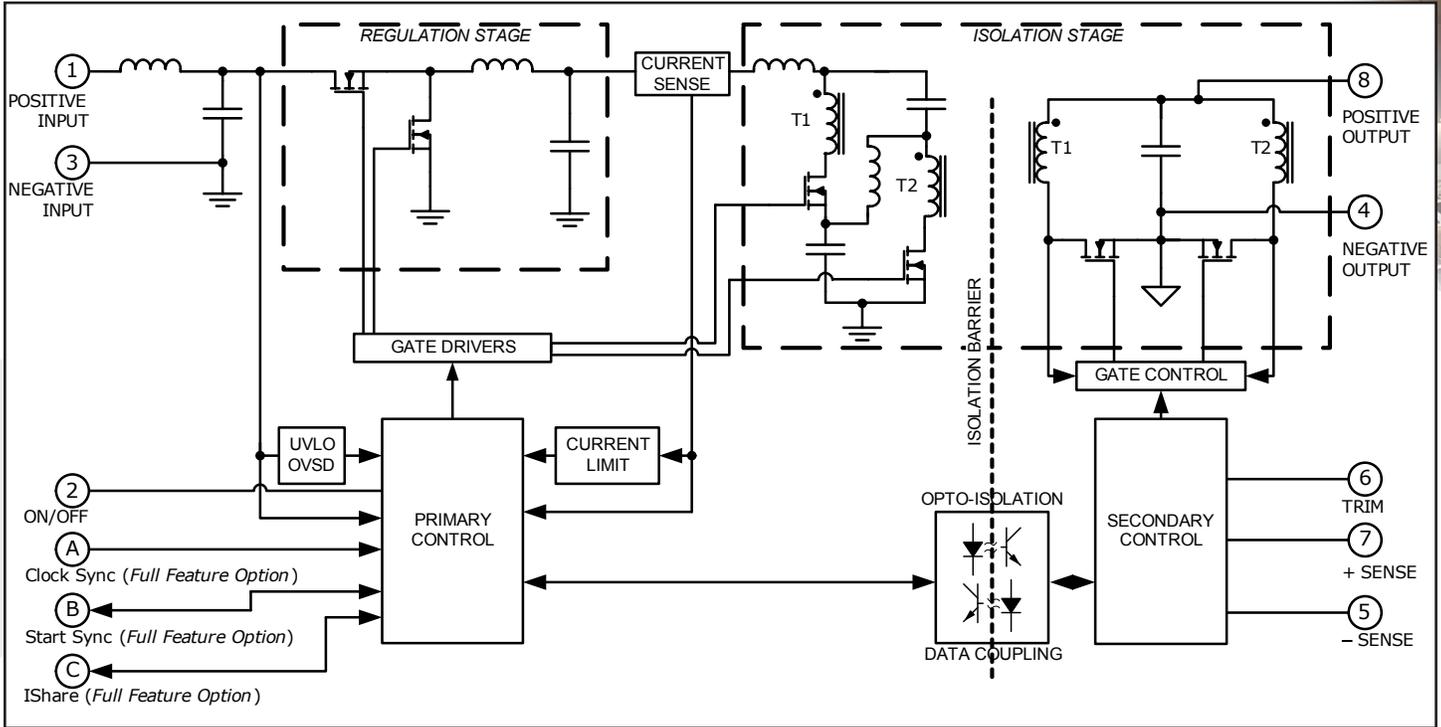

Protection Features

- Input under-voltage lockout
- Output current limit and short circuit protection
- Active back bias limit
- Output over-voltage protection
- Thermal shutdown

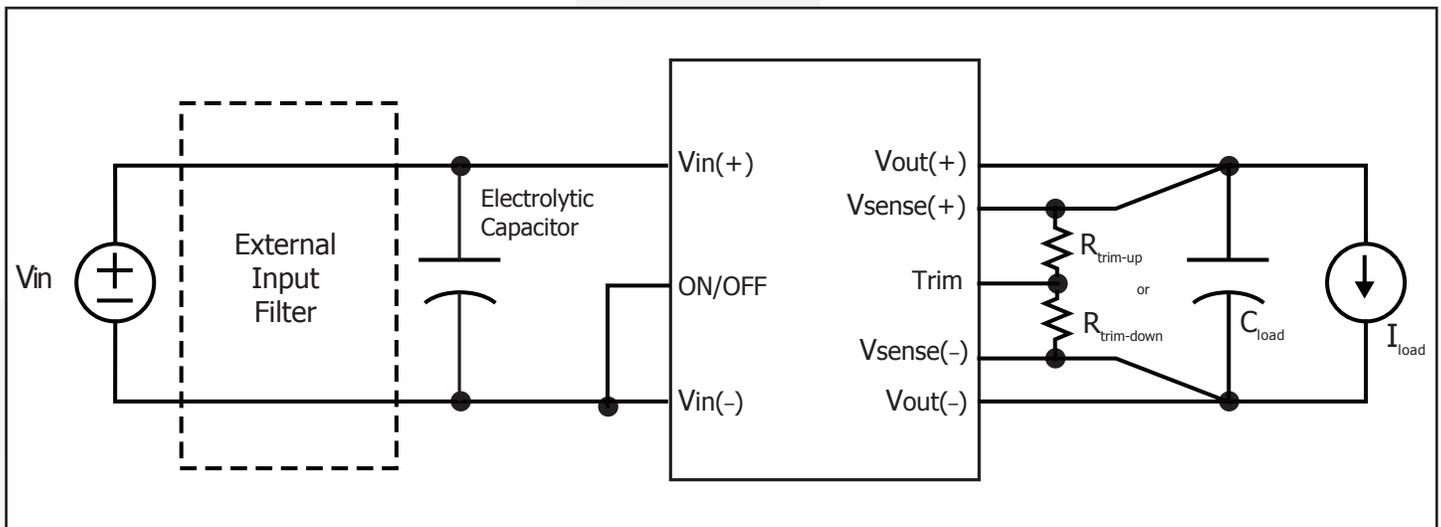

Screening/Qualification

- AS9100 and ISO 9001:2000 certified facility
- Qualification consistent with MIL-STD-883
- Available with S-Grade or M-Grade screening
- Pre-cap inspection per IPC-610, Class III
- Temperature cycling per MIL-STD-883, Method 1010, Condition B, 10 cycles
- Burn-In at 100C baseplate temperature
- Final visual inspection per MIL-STD-2008
- Full component traceability

Technical Specification

MCOTS-C-270N-08-HT

Output: 8.0V

Current: 50A

MCOTS-C-270N-08-HT ELECTRICAL CHARACTERISTICS

Tb = 25 °C, Vin = 270 Vdc unless otherwise noted; full operating temperature range is -55 °C to +100 °C baseplate temperature with appropriate power derating. Specifications subject to change without notice.

Parameter	Min.	Typ.	Max.	Units	Notes & Conditions
ABSOLUTE MAXIMUM RATINGS					
Input Voltage					
Non-Operating	-0.5		600	V	Continuous
Operating			280	V	Continuous
Operating Transient Protection			350	V	100ms transient, square wave
Isolation Voltage					
Input to Output			4250	V dc	
Input to Base-Plate			2300	V dc	
Output to Base-Plate			2300	V dc	
Operating Temperature	-55		+100	°C	Baseplate temperature
Storage Temperature	-65		+135	°C	
Voltage at ON/OFF input pin	-2		18	V	
INPUT CHARACTERISTICS					
Operating Input Voltage Range	240	270	280	V	350V transient for 100ms
Extended Operating Input Voltage Range	200	270	300	V	Power Derated to 350W
Input Under-Voltage Lockout					
Turn-On Voltage Threshold	185	190	195	V	
Turn-Off Voltage Threshold	173	178	183	V	
Lockout Voltage Hysteresis		12		V	
Recommended External Input Capacitance		3.3		µF	Typical ESR 8 Ω; see Note 1
Input Filter Component Values (L\C)		28/0.41		µH\µF	Internal values; see Figure E
Maximum Input Current			2.5	A	Vin min; trim up; in current limit
No-Load Input Current		55	110	mA	
Disabled Input Current		2	4	mA	
Response to Input Transient		0.52		V	See Figure 6
Input Terminal Ripple Current		200		mA	RMS, at full load
Recommended Input Fuse			5	A	Fast acting external fuse recommended
OUTPUT CHARACTERISTICS					
Output Voltage Set Point	7.92	8.00	8.08	V	
Output Voltage Regulation					
Over Line		±0.1	±0.3	%	
Over Load		±0.1	±0.3	%	
Over Temperature	-120		120	mV	
Total Output Voltage Range	7.8		8.2	V	Over sample, line, load, temperature & life
Output Voltage Ripple and Noise					
Peak-to-Peak		125	250	mV	Full load
RMS		35	70	mV	Full load
Operating Output Current Range			50	A	Subject to thermal derating
Output DC Current-Limit Inception	55	60	65	A	Output voltage 10% Low
Output DC Current-Limit Shutdown Voltage		4.3		V	
Back-Drive Current Limit while Enabled		4.8		A	Negative current drawn from output
Back-Drive Current Limit while Disabled		10		mA	Negative current drawn from output
Maximum Output Capacitance			4000	µF	Vout nominal at full load (resistive load)
Output Voltage during Load Current Transient					
Step Change in Output Current (0.1 A/µs)		300		mV	50% to 75% to 50% Iout max
Settling Time		600		µs	To within 1% Vout nom
Output Voltage Trim Range	-10		10	%	Across Pins 8&4; Figure C; see Note 3
Output Voltage Remote Sense Range			10	%	Across Pins 8&4
Output Over-Voltage Protection	9.36	9.76	10.16	V	Over full temp range
EFFICIENCY					
100% Load		88		%	See Figure 1 for efficiency curve
50% Load		89		%	See Figure 1 for efficiency curve

Note 1: An input capacitor with series resistance is necessary to provide system stability.

Note 2: Output is terminated with 1 µF ceramic and 15 µF low-ESR tantalum capacitors. For applications requiring reduced output voltage ripple and noise, consult SynQor applications support (e-mail: mqnbfoae@synqor.com)

Note 3: Trim-up range is limited below 10% at low line and full load. Applying more than 6.2V between trim pin and Vout(-) may damage the unit.

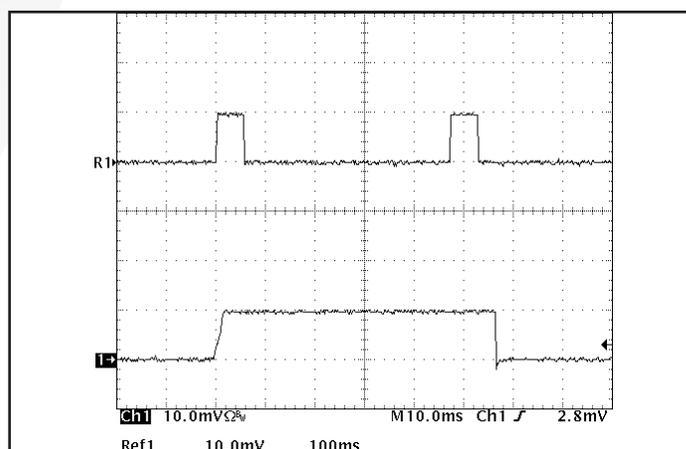

Figure 18: Load current (50A/div) as a function of time (10ms/div and 100ms/div) when the converter attempts to turn on into a 10 mΩ short circuit.

BASIC OPERATION AND FEATURES

This Mil-COTS converter series uses a two-stage power conversion topology. The first stage is a buck-converter that keeps the output voltage constant over variations in line, load, and temperature. The second stage uses a transformer to provide the functions of input/output isolation and voltage step-up or step-down to achieve the output voltage required.

Both the first stage and the second stage switch at a fixed frequency for predictable EMI performance. Rectification of the transformer's output is accomplished with synchronous rectifiers. These devices, which are MOSFETs with a very low on-state resistance, dissipate far less energy than Schottky diodes. This is the primary reason that the converter has such high efficiency, even at very low output voltages and very high output currents.

These converters are offered totally encased to withstand harsh environments and thermally demanding applications. Dissipation throughout the converter is so low that it does not require a heatsink for operation in many applications; however, adding a heatsink provides improved thermal derating performance in extreme situations.

This series of converters uses the industry standard footprint and pin-out configuration.

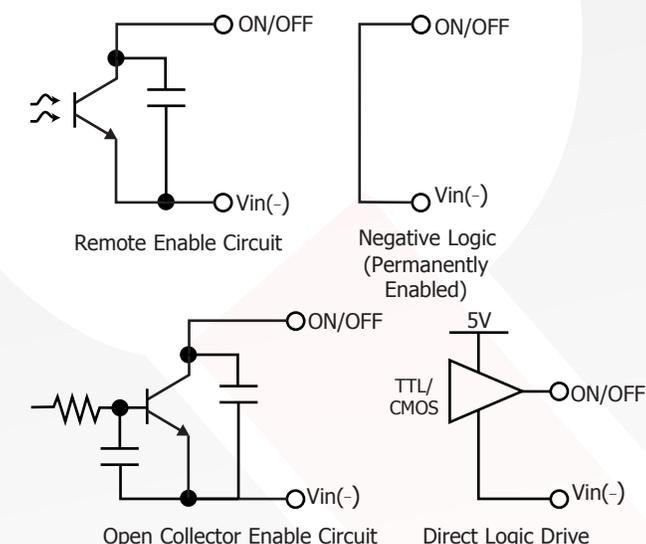

Figure A: Example of Intermediate Bus Architecture using BusQor bus converter and NiQor non-isolated converters

CONTROL FEATURES

REMOTE ON/OFF (Pin 2): The ON/OFF input, Pin 2, permits the user to control when the converter is on or off. This input is referenced to the return terminal of the input bus, Vin(-). The ON/OFF signal is active low (meaning that a low turns the converter on). Figure A details four possible circuits for driving the ON/OFF pin. Figure B is a detailed look of the internal ON/OFF circuitry.

REMOTE SENSE(+) (Pins 7 and 5): The SENSE(+) inputs correct for voltage drops along the conductors that connect the converter's output pins to the load. Pin 7 should be connected to Vout(+) and Pin 5 should be connected to Vout(-) at the point on the board where regulation is desired. A remote connection at the load can adjust for a voltage drop only as large as that specified in this datasheet, that is

$$[V_{out(+)} - V_{out(-)}] - [V_{sense(+)} - V_{sense(-)}] \leq \text{Sense Range \%} \times V_{out}$$

Pins 7 and 5 must be connected for proper regulation of the output voltage. If these connections are not made, the converter will deliver an output voltage that is slightly higher than its specified value. Note: the output over-voltage protection circuit senses the voltage across the output (pins 8 and 4) to determine when it should trigger, not the voltage across the converter's sense leads (pins 7 and 5). Therefore, the resistive drop on the board should be small enough so that output OVP does not trigger, even during load transients.

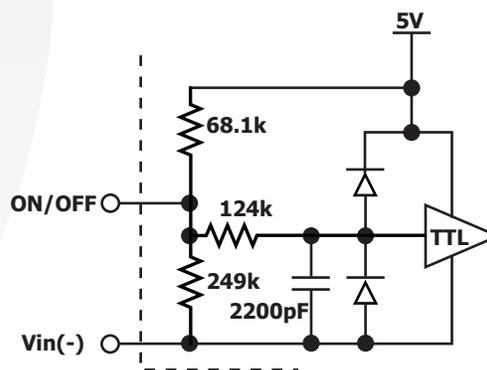

Figure B: Internal ON/OFF pin circuitry

OUTPUT VOLTAGE TRIM (Pin 6): The TRIM input permits the user to adjust the output voltage across the sense leads up or down according to the trim range specifications.

To decrease the output voltage, the user should connect a resistor between Pin 6 (TRIM) and Pin 5 (SENSE(-) input). For a desired decrease of the nominal output voltage, the value of the resistor should be

$$R_{\text{trim-down}} = \left(\frac{90.9}{\Delta\%} \right) - 0.909 \text{ (k}\Omega\text{)}$$

where

$$\Delta\% = \left| \frac{V_{\text{nominal}} - V_{\text{desired}}}{V_{\text{nominal}}} \right| \times 100\%$$

To increase the output voltage, the user should connect a resistor between Pin 6 (TRIM) and Pin 7 (SENSE(+)) input). For a desired increase of the nominal output voltage, the value of the resistor should be:

$$R_{\text{trim-up}} = \left(\frac{1.0V_{\text{OUT}} \times (100 + \Delta\%)}{1.225\Delta\%} - \frac{90.9}{\Delta\%} - 0.909 \right) \text{ (k}\Omega\text{)}$$

where

V_{out} = Nominal Output Voltage

Trim graphs show the relationship between the trim resistor value and $R_{\text{trim-up}}$ and $R_{\text{trim-down}}$, showing the total range the output voltage can be trimmed up or down.

Note: the TRIM feature does not affect the voltage at which the output over-voltage protection circuit is triggered. Trimming the output voltage too high may cause the over-voltage protection circuit to engage, particularly during transients.

It is not necessary for the user to add capacitance at the Trim pin. The node is internally bypassed to eliminate noise.

Total DC Variation of VOUT: For the converter to meet its full specifications, the maximum variation of the dc value of VOUT, due to both trimming and remote load voltage drops, should not be greater than that specified for the output voltage trim range.

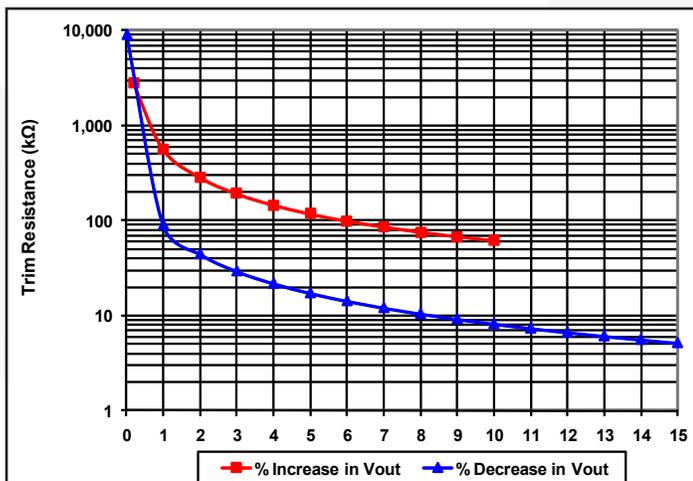

Figure C: Trim graph for trim-up, trim down.

Protection Features

Input Under-Voltage Lockout: The converter is designed to turn off when the input voltage is too low, helping avoid an input system instability problem, described in more detail in the application note titled "Input System Instability" available on www.SynQor.com. The lockout circuitry is a comparator with DC hysteresis. When the input voltage is rising, it must exceed the typical Turn-On Voltage Threshold value (listed on the specification page) before the converter will turn on. Once the converter is on, the input voltage must fall below the typical Turn-Off Voltage Threshold value before the converter will turn off.

Output Over-Voltage Limit: If the voltage across the output pins exceeds the Output Over-Voltage Protection threshold, the converter will immediately stop switching. This prevents damage to the load circuit due to 1) excessive series resistance in output current path from converter output pins to sense point, 2) a release of a short-circuit condition, or 3) a release of a current limit condition. Load capacitance determines exactly how high the output voltage will rise in response to these conditions. After 400 ms the converter will automatically restart.

Over-Temperature Shutdown: A temperature sensor on the converter senses the average temperature of the module. The thermal shutdown circuit is designed to turn the converter off when the temperature at the sensed location reaches the Over-Temperature Shutdown value. It will allow the converter to turn on again when the temperature of the sensed location falls by the amount of the Over-Temperature Shutdown Restart Hysteresis value.

Output Current Limit: The maximum current limit remains constant as the output voltage drops. However, once the impedance of the load across the output is small enough to make the output voltage drop below the specified Output DC Current-Limit Shutdown Voltage, the converter turns off.

The converter then enters a "hiccup" mode where it repeatedly turns on and off at a 2.23 Hz (nominal) frequency with 11% duty cycle until the short circuit condition is removed. This prevents excessive heating of the converter or the load board.

APPLICATION CONSIDERATIONS

Input System Instability: This condition can occur because any dc-dc converter appears incrementally as a negative resistance load. A detailed application note titled "Input System Instability" is available on the SynQor website which provides an understanding of why this instability arises, and shows the preferred solution for correcting it.

Application Circuits: Figure D provides a typical circuit diagram which details the input filtering and voltage trimming.

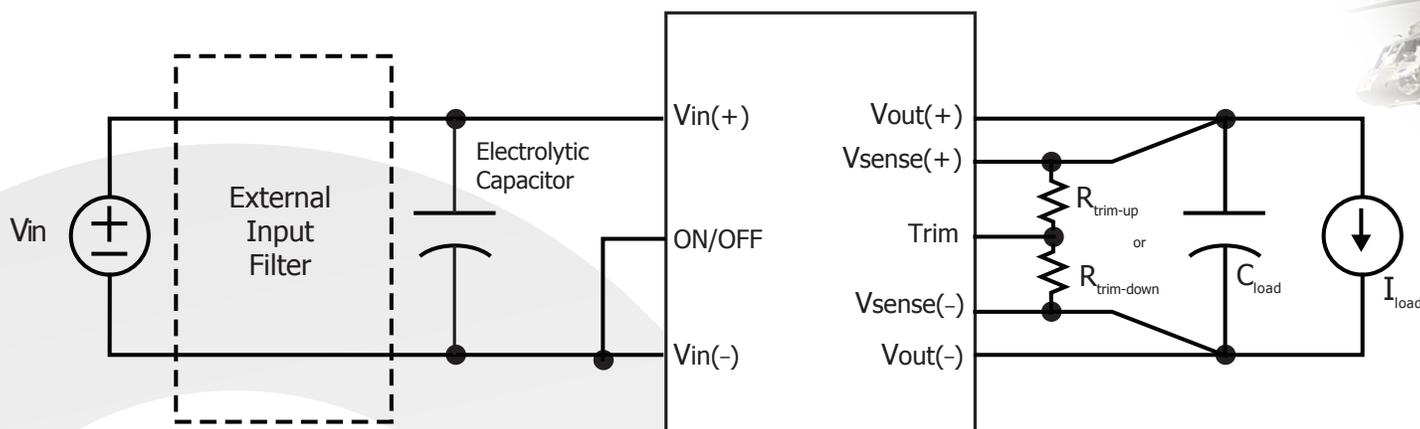

Figure D: Typical application circuit (negative logic unit, permanently enabled).

Input Filtering and External Capacitance: Figure E provides a diagram showing the internal input filter components. This filter dramatically reduces input terminal ripple current, which otherwise could exceed the rating of the converter's external electrolytic input capacitor. The recommended external input capacitance is specified in the Input Characteristics section on the Electrical Characteristics page. More detailed information is available in the application note titled "EMI Characteristics" on the SynQor website.

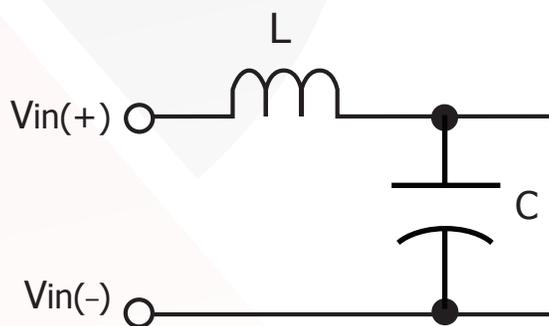

Figure E: Power Up/Down Diagram (not to scale) showing Start-Up Inhibit Period.

Startup Inhibit Period: The Startup Inhibit Period ensures that the converter will remain off for approximately 400 ms when it is shut down for any reason. When an output short is present, this generates a 2.23 Hz “hiccup” mode, which prevents the converter from overheating. In all, there are seven ways that the converter can be shut down, initiating a Startup Inhibit Period:

- Input Under-Voltage Lockout
- Input Over-Voltage Lockout
- Output Over-Voltage Protection
- Over Temperature Shutdown
- Current Limit
- Short Circuit Protection
- Turned off by the ON/OFF input

Figure F shows three turn-on scenarios, where a Startup Inhibit Period is initiated at t_0 , t_1 , and t_2 :

Before time t_0 , when the input voltage is below the UVL threshold, the unit is disabled by the Input Under-Voltage Lockout feature. When the input voltage rises above the UVL threshold, the Input Under-Voltage lockout is released, and a Startup Inhibit Period is initiated. At the end of this delay, the ON/OFF pin is evaluated, and since it is active, the unit turns on.

At time t_1 , the unit is disabled by the ON/OFF pin, and it cannot be enabled again until the Startup Inhibit Period has elapsed.

When the ON/OFF pin goes high after t_2 , the Startup Inhibit Period has elapsed, and the output turns on within the typical Turn-On Time.

Thermal Considerations: The maximum operating base-plate temperature, T_B , is 100 °C. Refer to the thermal derating curve, Figure 5, to see the available output current at baseplate temperatures below 100 °C.

A power derating curve can be calculated for any heatsink that is attached to the base-plate of the converter. It is only necessary to determine the thermal resistance, $R_{TH_{BA}}$, of the chosen heatsink between the base-plate and the ambient air for a given airflow rate. This information is usually available from the heatsink vendor. The following formula can then be used to determine the maximum power the converter can dissipate for a given thermal condition:

$$P_{diss}^{max} = \frac{T_B - T_A}{R_{TH_{BA}}}$$

This value of power dissipation can then be used in conjunction with the data shown in Figure 3 to determine the maximum load current (and power) that the converter can deliver in the given thermal condition.

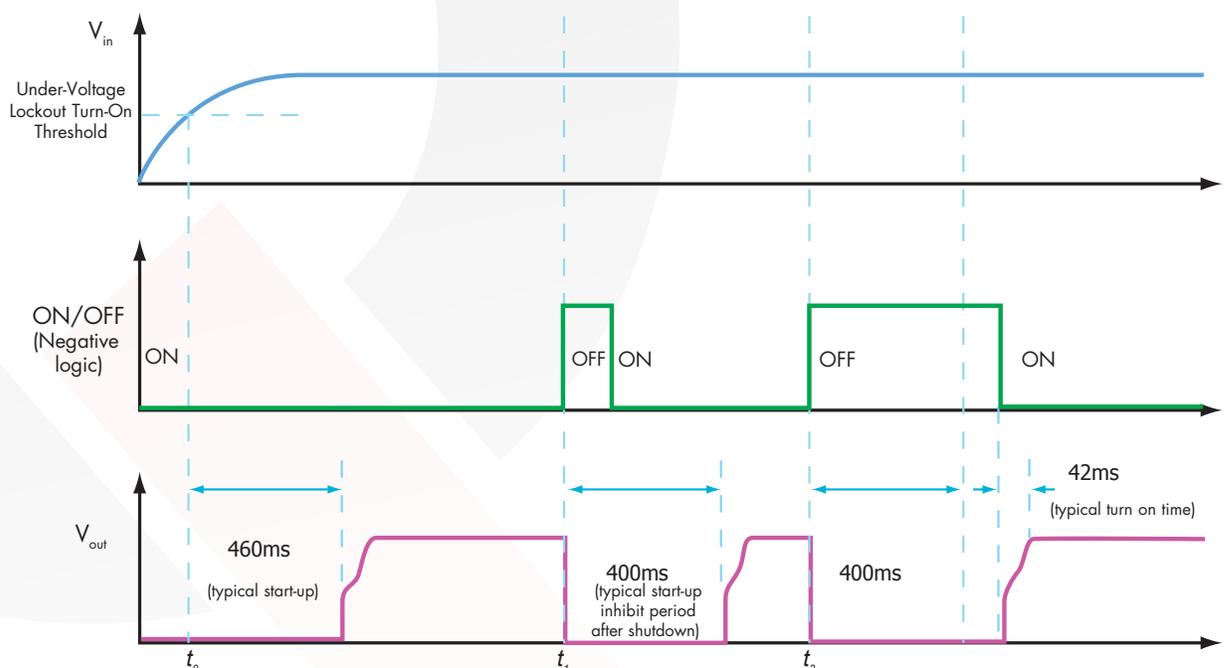

Figure F: Startup Inhibit Period (turn-on time not to scale)

Full-Featured Application Notes

This section provides some basic application information for the full-feature version of the MCOTS series converter.

All units in this product family include back-drive protection to simplify the use of multiple converters in a parallel or sequencing application. However, any voltage applied to the output of the converter should be kept below 120% of the rated output voltage of the converter.

In addition to back-drive protection, these units include the following features (pins):

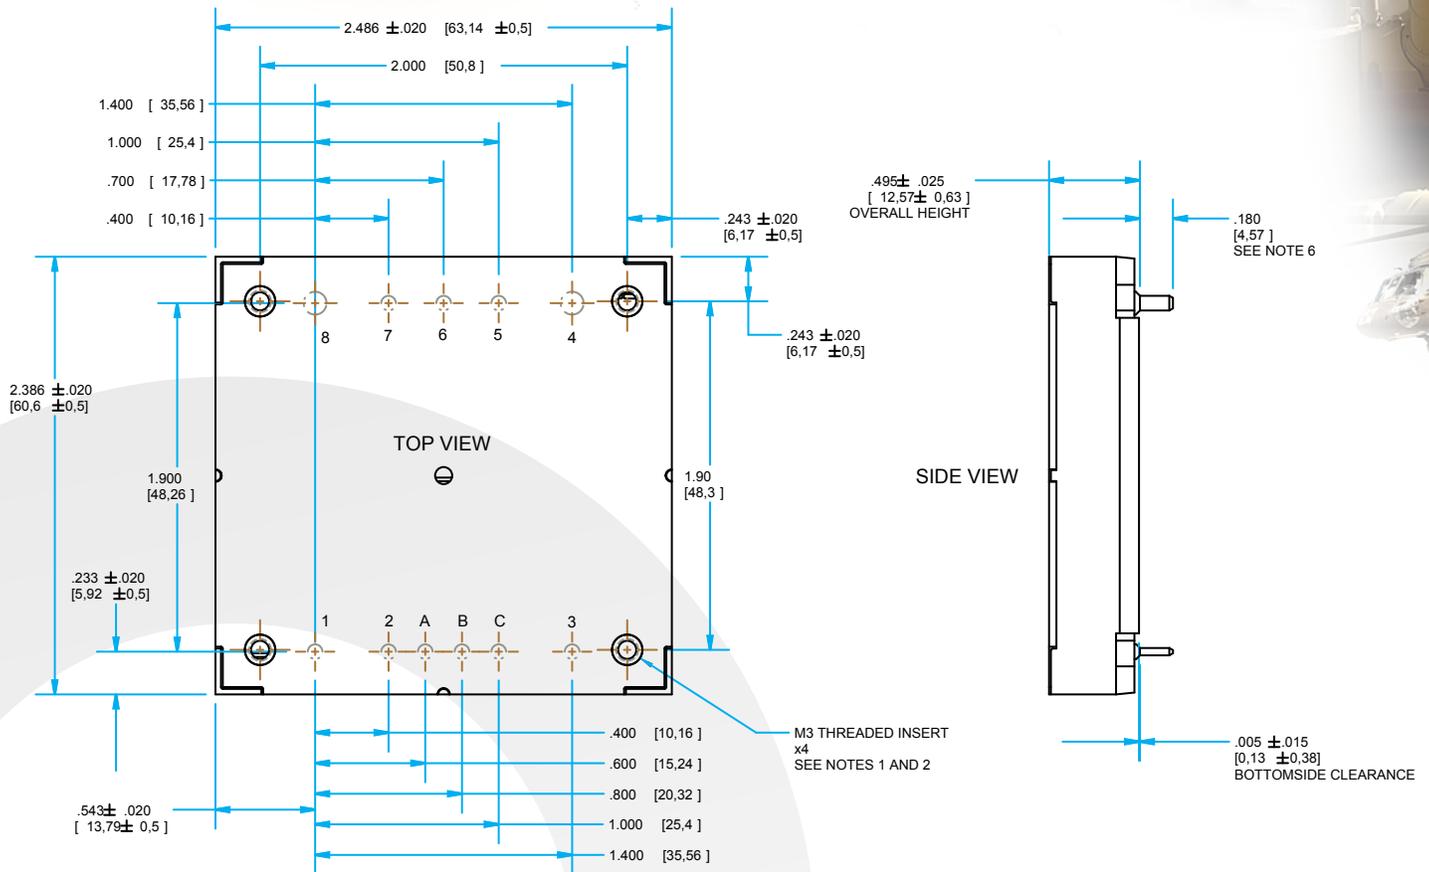

Current Share (pin C): The active current share feature allows for N+1 and parallel applications. To achieve load sharing, directly connect the I share pins of multiple units. The load current will share equally among the multiple units ($\pm 5\%$ at full rated current). It is important that the Vin(-) pins of the sharing units be directly connected and NOT placed outside of an EMI filter or other impedance path. The voltage at the I Share pin will range from 0 to 5 volts (at full rated current), referenced to the primary-side ground, Vin(-).

Start Sync (pin B): The Start Synchronization pin will allow a more consistent start-up sequence. To operate this feature, connect together the Start-Sync pins of multiple current-sharing units. This will permit immediate start-up with loads greater than the current limit of a single unit. Without this connection, any set of converters attempting to asynchronously start (or re-start) with a load greater than the current limit of a single unit will "hiccup". This "hiccup" mode will continue until one converter attempts a start at the same time as the minimum number of additional units necessary to sustain the load condition. For example, three 50 amp units starting into a 90 amp load would require two units to simultaneously attempt a start. The Start Sync connection synchronizes these starting attempts and provides a more consistent and reliable start-up sequence. For details about the "hiccup" mode or repeated startup attempts, please see the "Startup Inhibit Period" note in the Technical Specification.

Clock Sync (pin A): The External Clock Synchronization pin provides the ability for the user to control the EMI signature and synchronize sensitive circuitry to quiet periods in the converter operation. With this option, the converter can be synchronized to an external clock signal whose frequency is greater than that of the free-running internal clock. However, substantially raising the converter's frequency will reduce its efficiency. Therefore, the recommended frequency range for the external clock synchronization signal applied to this pin is listed in the Technical Specification.

The following requirements should also be met:

- The external clock signal should be referenced to the negative input voltage, Vin(-)
- The high level of the signal should be between 3.5V and 5.0V.
- The low level should be between -0.5V and +1.2V.
- Do not apply a clock sync or change frequency while unit is running.
- Do not apply a clock signal lower than the specified frequency.

NOTES

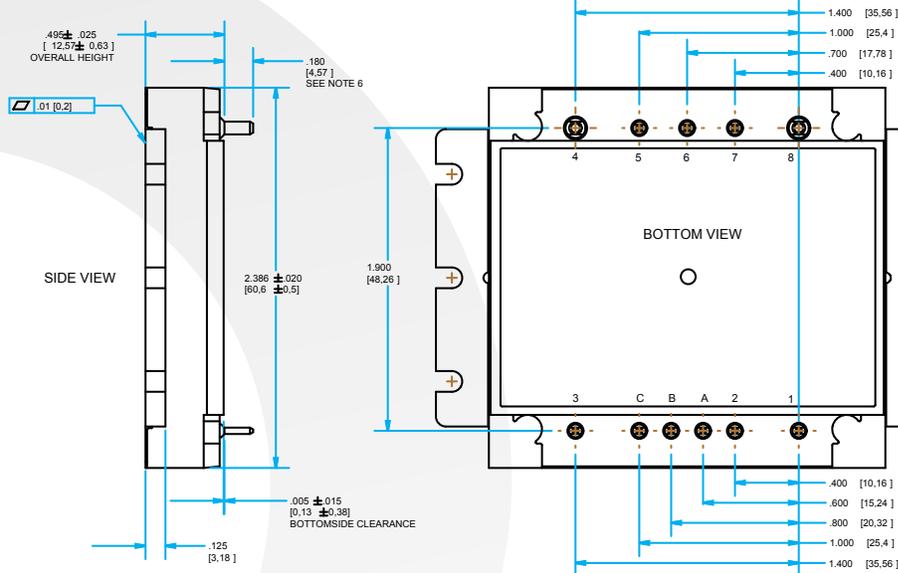

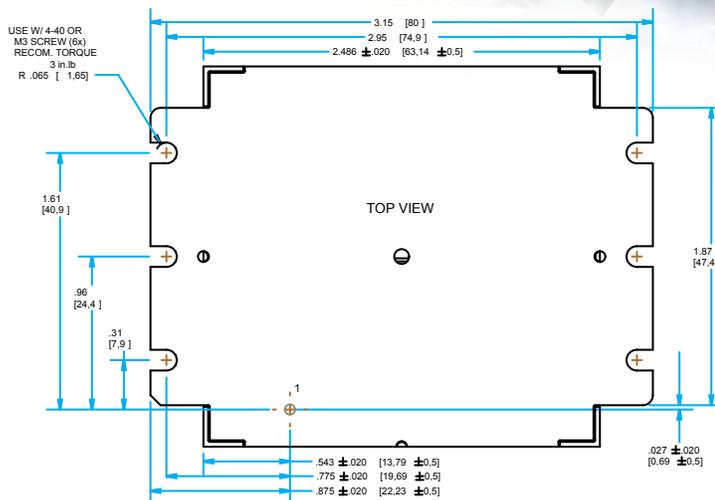

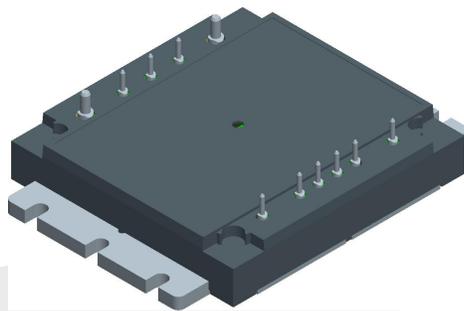

- M3 screws used to bolt unit's baseplate to other surfaces such as heatsink must not exceed 0.100" (2.54mm) depth below the surface of the baseplate.
- Applied torque per screw should not exceed 6in-lb (0.7Nm).
- Baseplate flatness tolerance is 0.004" (.10mm) TIR for surface
- Pins 1-3, 5-7, A, B, & C are 0.040" (1.02mm) dia. with 0.080" (2.03mm) dia. standoff shoulders
- Pins 4 and 8 are 0.080" (2.03mm) dia. with .125" (3.18) dia. standoff shoulders
- Other pin extension lengths available
- All Pins: Material: Copper Alloy
Finish: Matte Tin over Nickel plate
- Undimensioned components are shown for visual reference only
- Weight: 4.8oz (135g)

PIN DESIGNATIONS

Pin	Name	Function
1	Vin(+)	Positive input voltage
2	ON/OFF	TTL input to turn converter on and off, referenced to Vin(-), with internal pull up.
A	Clock Sync	Clock synchronization (Full Feature Option)
B	Start Sync	Startup synchronization (Full Feature Option)
C	Ishare	Single wire parallel signal (Full Feature Option)
3	Vin(-)	Negative input voltage
4	Vout(-)	Negative output voltage
5	SENSE(-)	Negative remote sense(see note 1)
6	TRIM	Output voltage trim (see note 2)
7	SENSE(+)	Positive remote sense (see note 3)
8	Vout(+)	Positive output voltage

Notes:

- SENSE(-) should be connected to Vout(-) either remotely or at the converter.
- Leave TRIM pin open for nominal output voltage.
- SENSE(+) should be connected to Vout(+) either remotely or at the converter.
- Pins A, B, and C are populated on Full Feature version only.

NOTES

- 1) Applied torque per screw should not exceed 5in-lb. (3in-lb recommended).
- 2) Baseplate flatness tolerance is 0.01" (.2mm) TIR for surface.
- 3) Pins 1-3, 5-7, A, B, & C are 0.040" (1.02mm) diameter with 0.080" (2.03mm) diameter standoff shoulders
- 4) Pins 4 and 8 are 0.080" (2.03mm) diameter with .125" (3.18) diameter standoff shoulders
- 5) Other pin extension lengths available
- 6) All Pins: Material: Copper Alloy
Finish: Matte Tin over Nickel plate
- 7) Undimensioned components are shown for visual reference only.
- 8) Weight: 5.0oz (141g)
- 9) All dimensions in inches (mm)
Tolerances: x.xx +/-0.02 in. (x.x +/-0.5mm)
x.xxx +/-0.010 in. (x.xx +/-0.25mm)

PIN DESIGNATIONS

Pin	Name	Function
1	Vin(+)	Positive input voltage
2	ON/OFF	TTL input to turn converter on and off, referenced to Vin(-), with internal pull up.
A	Clock Sync	Clock synchronization (Full Feature Option)
B	Start Sync	Startup synchronization (Full Feature Option)
C	Ishare	Single wire parallel signal (Full Feature Option)
3	Vin(-)	Negative input voltage
4	Vout(-)	Negative output voltage
5	SENSE(-)	Negative remote sense(see note 1)
6	TRIM	Output voltage trim (see note 2)
7	SENSE(+)	Positive remote sense (see note 3)
8	Vout(+)	Positive output voltage

Notes:

- 1) SENSE(-) should be connected to Vout(-) either remotely or at the converter.
- 2) Leave TRIM pin open for nominal output voltage.
- 3) SENSE(+) should be connected to Vout(+) either remotely or at the converter.
- 4) Pins A, B, and C are populated on Full Feature version only.

Mil-COTS Qualification

Test Name	Details	# Tested (# Failed)	Consistent with MIL-STD-883F Method	Consistent with MIL-STD-883F Method 5005
